1.0 INTRODUCTION

This report presents the results of the supplemental data gap investigation activities and 2016 and 2017 groundwater well sampling events conducted at the Alabama Army National Guard (ALARNG) Organizational Maintenance Shop (OMS) #28 located at the former Brookley Air Force Base (AFB). AECOM Technical Services, Inc. (AECOM) was contracted by the U.S. Army Corps of Engineers (USACE), Mobile District under the Contract Number W90FYQ10D0010 Task Order CK02 to conduct the field investigations, groundwater monitoring, and reporting. The Defense Environmental Restoration Program (DERP) at ALARNG OMS #28 follows the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) and National Contingency Plan processes, consistent with DERP guidance.

1.1 PURPOSE AND SCOPE OF WORK

The scope and objectives of the supplemental data gap investigation and groundwater well sampling activities were initially presented in a Uniform Federal Policy-Quality Assurance Project Plan (UFP-QAPP) Work Plan prepared by AECOM and submitted to the Alabama Department of Environmental Management (ADEM) in January 2016. An addendum to the UFP-QAPP Work Plan, Appendix D, was submitted to ADEM in January 2018.

Based on the results of the Remedial Investigation (RI; Scientific Applications International Corporation [SAIC], May 2013), a Feasibility Study (FS) was developed to address soil and groundwater impacted with chlorinated volatile organic compounds (VOCs) (Leidos, February 2014). In order to perform the recommended alternative of the FS, biological/chemical reduction of groundwater with excavation of soil, the Site's conceptual site model (CSM) required further refinement. The objectives of this Supplemental Data Gap Investigation were to conduct an investigation to identify if other soil source areas were contributing to groundwater contamination and to improve the delineation of the known groundwater contaminant plume. Furthermore, locations for additional monitoring wells were to be proposed based on the improved delineation of the groundwater plume.

1.2 SITE LOCATION AND DESCRIPTION

OMS #28 is located in Mobile County approximately 3 miles south of downtown Mobile (**Figure 1-1**) at 1622 South Broad Street, between U.S. Interstate Highway 10 (I-10) and Mobile Bay (**Figure 1-2**). The property is relatively flat with an elevation of approximately 20 to 30 feet above mean sea level (msl). The OMS #28 site is bordered by undeveloped land and I-10 to the west; residential property to the north; the OMS #28 shop and Fort Floyd A. McCorkle Army National Guard (ARNG) facility building to the east; and commercial and industrial properties to the south (**Figure 1-3**). The vegetative cover consists of mainly oak trees, scrub, brush, and grasses. The nearest residential structure is approximately 150 feet north of the OMS #28 maintenance building.

OMS #28 is located in the northwest corner of the former Brookley AFB, which is now called the Brookley Aeroplex. The initial 1,000 acres of Brookley AFB were acquired by the Department of Defense (DoD) in 1938 with additional land acquisitions through 1955 for a total of 3,156 acres. Brookley AFB was operated by the Air Force as a general support and supply base until June 1969 when it was officially closed. The DoD returned Brookley AFB to the city of Mobile and the city created the Mobile Airport Authority (MAA) in 1972. Facilities at the Brookley Aeroplex include runways and maintenance areas for

aircraft, underground and aboveground fuel storage facilities, associated buildings, roads, housing, and landfills. No human consumption or agricultural wells are located within the boundaries of the Brookley Aeroplex. The Brookley Aeroplex is currently used as an industrial complex and airport by the MAA (SAIC, May 2013).

Currently, the Alabama Armory Commission owns the 5.9 acres of property on which OMS #28 is located, and ALARNG operates the Field Maintenance Shop (FMS) (formerly known as the OMS). The Alabama Armory Commission has owned this property since 1953 when the City of Mobile conveyed 25.66 acres to the Commission. In 2002, 6.43 acres west of the OMS #28 property reverted back to the City and the City subsequently conveyed the property to the MAA (SAIC, May 2013).

It should be noted that the ALARNG renamed OMS #28 to FMS #28 several years ago; however, the Site is referred to as OMS #28 in all previous ALARNG, ADEM, and USACE investigation reports; therefore, to avoid confusion, the Site is referred to herein as OMS #28. According to ALARNG personnel, Site operations have not significantly changed since conversion to FMS #28 (Louis Berger, August 2015).

1.3 SITE BACKGROUND AND HISTORY

The Site has undergone numerous development, redevelopment, and organizational periods since its initial development. The original/former OMS #28 building was constructed in the early 1950's and its former location is shown in Figure 1-3. The OMS #28 operations were transferred from the old/original building to the current OMS #28 building after it was constructed in 1978. The original/former OMS #28 building was used for storage from 1978 until demolition in 2001. Operations within OMS #29 were also transferred to the new OMS #28 building and the old OMS #29 building, constructed in the 1960's, was used for storage and eventually demolished. The OMS #28 building was expanded in 1994 to accommodate a greater volume of work. Currently, the OMS #28 building is used for vehicle staging, vehicle maintenance, and direct support for military police, medical, signal, communications, and field artillery units (Louis Berger, August 2015).

A wash pad in the far northwestern corner of the parking lot was used until 1978. The wash pad was constructed as a concrete slab with no drainage system in place. Military vehicles were routinely washed in this area and wash water was allowed to flow freely onto the ground.

Four underground storage tanks (USTs) were removed from three separate locations (Pit 1, Pit 2, and Pit 3) at the Site in October 1992. Upon removal of a single 2,000-gallon gas/diesel UST at Pit 2, petroleum-related soil and groundwater contamination was identified; however, a preliminary sampling effort was unable to determine the nature and extent of the contaminants. Additional investigation in December 1994 was reported to have completely delineated the extent of petroleum-related soil and groundwater contamination associated with Pit 2. Quarterly groundwater monitoring for petroleum-related contaminants began in 1995 and continued through 2004. Subsequently, analysis of quarterly groundwater sampling results indicated that petroleum contamination had migrated beyond the original monitoring well network installed during the initial 1994 groundwater investigation. As a result, further Site characterization was deemed necessary and was performed in 2004 and 2005. This supplemental work consisted of the installation of additional monitoring wells at the Site in an attempt to delineate petroleum contamination associated with Pit 2 (Louis Berger, August 2015). The relevant historical features are depicted on **Figure 1-3**.

In March 2005, trichloroethene (TCE) was detected at the Site for the first time in monitoring well MW-8. The presence of TCE in well MW-8 was determined to be unrelated to the petroleum tanks that were removed from the Site in 1992. The source of TCE was unknown; however, the limited extent suggests that it is potentially the result of a localized solvent spill (Aerostar, April 2007). In April 2007, TCE-contaminated soil was observed in discrete potential source areas within the TCE, and later tetrachloroethene (PCE), plume. Installation and sampling of additional monitoring wells was conducted in November 2008 in order to delineate the horizontal and vertical extents of TCE and PCE groundwater contamination at the Site (Louis Berger, August 2015).

Historically, TCE concentrations were documented as high as 11 micrograms per liter (µg/L) at off-site monitoring well MW-10 and 63 µg/L at MW-11 in 2006. These monitoring wells were installed northwest of the Site, on private residential property (Figure 1-3). Monitoring wells MW-10 and MW-11 were subsequently abandoned in 2008 at the property owner's request and have not been replaced (Louis Berger, August 2015). Based on contemporaneous analysis of the 2010 groundwater data, the groundwater flow direction did not appear to indicate that the plume was or would impact the residential properties to the north of the OMS #28 building. These residential properties were thought to be side and/or up gradient of the source area and groundwater flow direction.

Groundwater compliance monitoring was conducted at the Site in December 2008, May 2009, September 2009, March 2010, and September 2010 at monitoring wells MW-5, MW-6, MW-8, MW-9, MW-12, and OMS-28-1 through OMS-28-7. The monitoring effort was implemented to document and monitor groundwater conditions at the Site (Louis Berger, August 2015).

Based on the investigative work completed prior to this Supplemental Data Gap Investigation, the potential source area for the TCE plume was suspected to be the former washpad near monitoring well MW-8, which corresponds with the suspected area of residual soil contamination. PCE groundwater contamination was originally thought to be limited to the area surrounding monitoring well OMS-28-5, which is located within a densely wooded area west of the Site. It was noted during a site reconnaissance performed by Louis Berger in 2015 that in the 1960's and 1970's "Gunk" Energized Electric Motor Contact Cleaner was used as a cleaning agent. According to a retired ALARNG employee, "Gunk" was used during the same time as the wash pad; however, there is no official record of "Gunk" being used near the wash pad (Louis Berger, August 2015). According to Material Safety Data Sheets, "Gunk" cleaners may contain up to 90-100% PCE.

Initially, the OMS #28 chlorinated solvent plume was following a Resource Conservation and Recovery Act (RCRA) cleanup path due to the actions required following the discovery of TCE under the UST regulatory requirements. In September 2010, ALARNG submitted a request to ADEM to continue the activities at the Site under CERCLA. At the time, ALARNG was in the process of having an Alabama Risk Based Corrective Action (ARBCA) Report prepared (Aerostar, March 2011) and recommended using the existing data to develop an RI/FS. ADEM concurred with this approach in e-mail correspondence dated September 9, 2010 (ADEM, September 2010).

1.4 PREVIOUS INVESTIGATIONS

Previous environmental investigations at OMS #28 were conducted as part of the UST closure process. These original investigations centered on the contamination associated with the UST located at Pit 2.

The UST-related investigations that have been performed at OMS #28 were documented in the following reports:

- UST Closure Site Assessment Report, The Amory Commission of Alabama, OMS #28 and 29 – Pit #1, Pit #2 and Pit #3 (CWA Group, Inc., November 1992);
- Preliminary Investigation Report, OMS #28 Pit #2 (P.E. LaMoreaux and Associates, Inc.[PELA], December 1993);
- Underground Storage Tank Secondary Investigation Report, Alabama National Guard Armory, OMS#28 and 29 – Pit #2 (PELA, December 1994); and
- Secondary Investigation Addendum Report (Bechtel-S, August 2005).

ADEM determined that no further subsurface investigation was required for the UST located at Pit 2 (correspondence dated January 19, 2007, [ADEM, January 2007]).

This Data Gap Investigation addresses the chlorinated solvent groundwater plume. The details of the investigation of the TCE detection in well MW-8 in 2005 are documented in the following reports:

- TCE Comprehensive Investigation at the Organizational Maintenance Shop 28 (Aerostar, April 2007);
- Supplemental Comprehensive Investigation Report for the Alabama Army National Guard Organizational Maintenance Shop 28 (Aerostar, November 2008); and
- Supplemental Comprehensive Investigation Groundwater Monitoring Reports for OMS-28 (Aerostar, April 2009, August 2009, December 2009, June 2010, and January 2011).

The results of these TCE-related investigations were compiled into an RI without the collection of any additional field or sample data (SAIC, May 2013). The RI concluded that four VOCs (cis-1,2-dichloroethene [DCE], methylene chloride, PCE, and TCE) detected in site soils exceeded their respective soil screening levels (SSLs) for the protection of groundwater. Three areas of soil contamination were speculated to be acting as residual sources for TCE and PCE groundwater plumes (**Figure 1-4**). The largest area of soil contamination exceeding the protection of groundwater SSLs was identified in the vicinity of well MW-8, with a vertical extent of contamination throughout the unsaturated zone (ground surface to approximately 15 feet below ground surface [bgs]). Two smaller, isolated areas of soil contamination exceeding the protection of groundwater SSLs were located approximately 200 feet northwest of well MW-8 (around soil boring location B-17) and approximately 250 feet west of well MW-8 (around well MW-9), both on the MAA property.

The RI also reported a groundwater plume of TCE above the United States Environmental Protection Agency (USEPA) Drinking Water Maximum Contamination Limit (MCL; USEPA, March 2018) occurring across the Site and adjacent properties (**Figure 1-5**) within the shallow aquifer described as the water table. A smaller PCE plume was also reported within the larger TCE plume boundary occurring on the MAA property (**Figure 1-5**). The RI also noted that the horizontal extent of the TCE boundary in the area of the residential properties, as well as the vertical delineation of the groundwater plume, had not been fully investigated (SAIC, May 2013).

Based on the compilation of data reported in the RI, an FS was conducted, which recommended a biological/chemical reduction of groundwater and the excavation of soils at the Site. The selected alternative included the proposed injection of an engineered vegetable oil substrate package or other

carbon source for treatment of groundwater until the MCLs for TCE and PCE are achieved. To expedite the remedial timeframe following injection, this alternative also included the excavation of the residual soil mass that is acting as a continuing source for groundwater contamination and transportation of the resulting waste to a permitted municipal solid waste landfill for disposal (Leidos, February 2014).

2.0 CONCEPTUAL SITE MODEL

2.1 TOPOGRAPHY

Mobile is located within the Coastal Lowlands District areas and characterized by flat to gently undulating, locally swampy plains underlain by terrigenous deposits. They include the mainland plain, which is indented by many tidal streams and fringed by tidal marshes and barrier islands. The landward edge of the district is defined by the base of the Pamlico marine scarp at 25 to 30 feet of elevation. The barrier islands and tidal marshes in the area are undergoing continual modification by erosion and deposition (SAIC, May 2013). A topographic map of Mobile Bay is provided in **Figure 2-1**.

The Brookley Aeroplex is relatively flat with an elevation of 20 to 30 feet above MSL (Aerostar, March 2011). OMS #28 is located in the northeast corner of the Brookley Aeroplex where the elevations are closer to 30 feet above MSL (SAIC, May 2013). Large areas along the Mobile and Tensaw Rivers and along the coast are characterized by low-lying, swampy terrain and brackish water. The Brookley Aeroplex is included in this area (SAIC, May 2013).

2.2 LAND USE

The Brookley Aeroplex is located within Mobile County. Much of the land in Mobile County is used for industrial and agricultural purposes.

The current land use is based on a site reconnaissance performed by Louis Berger on March 31, 2015 and April 30, 2015 (Louis Berger, August 2015). The Site is developed with the OMS #28 building and several other smaller storage buildings. At the time of the reconnaissance, the ancillary storage buildings contained items such as miscellaneous wood items, fans, vehicle ramps, fire extinguishers, and miscellaneous metal. Each storage building is constructed as slab-on-grade. There was no staining or other evidence of release observed in these buildings. No operations, other than storage, are performed in these buildings. The majority of the Site is developed with concrete-paved driveways and vehicle storage areas. Some areas of the Site are unpaved and used for vehicle storage. Numerous military vehicles were stored at the Site at the time of the visit. Drip pans were present beneath nearly all of the vehicles (Louis Berger, August 2015).

The majority of the OMS #28 building consists of five vehicle bays (10 total work spaces) where routine maintenance on military vehicles is performed. The remainder of the building consists of office space and a break room. Servicing of military vehicles includes fluid changes and routine inspections to ensure safety and functionality. Waste oil generated in the work bays is deposited into one of two waste oil above-ground storage tanks along the north side of the building. Other waste vehicle fluids are containerized in 5- or 55-gallon drums and stored in a designated “Hazardous Materials Storage Area” or “Petroleum Products Storage Area” until pick-up and off-site disposal by an outside contractor on an as-needed basis. These storage areas appeared well maintained, clean, and were equipped with secondary containment systems for spills (Louis Berger, August 2015).

Two vehicle wash racks are present at the Site and are connected to a single oil/water separator. One wash rack is located north of the OMS #28 building and the other is located west of the building. According to onsite personnel, the northern wash rack is rarely used because the drain easily clogs. The western wash rack is equipped with a large hydraulic oil lift system capable of lifting large/heavy military

vehicles. A trench drain at this rack drains into an underground cistern where the oil and water mixture separates.

A concrete pad reported to measure approximately 50 feet wide by 50 feet long was observed in the wooded area approximately 50 feet west of the property line (fence line) of OMS #28 (**Figure 1-3**) during the 2015 reconnaissance by Louis Berger. The concrete pad comprised of six distinct and individual strips of concrete spaced a few inches apart. The concrete pad corresponds to the approximate former location of Mollison Hall, a recreational hall for soldiers, and is possibly a building foundation remnant.

2.3 SURFACE WATER HYDROLOGY

According to the Brookley AFB RI Report (Kevric, February 2004), the Brookley Aeroplex is part of the Mobile Bay Watershed. The fluvial drainage area of this watershed encompasses nearly two-thirds of the state of Alabama and crosses into Georgia, Mississippi, and Tennessee. According to the USEPA State Health Evaluation (USEPA, September 1999), this coastal lowlands aquifer system has an Index Watershed Indicator of "Less Serious Water Quality Problems (Low Vulnerability to Stressors such as Pollutant Loading)." Furthermore, ADEM's 2010 Alabama Unified Watershed Assessment classified parts of Mobile Bay as Category 1 – "waters that are attaining all applicable water quality standards" or Category 5 – "waters in which a pollutant has caused or is suspected of causing impairment" (ADEM, April 2010). The Category 1 classification was associated with Mobile County. The Baldwin County portion of Mobile Bay received the Category 5 classification (SAIC, May 2013).

Surface flow from storm water runoff across the Site varies due to surface grade, vegetation, and porous surface medium (SAIC, May 2013). During a site reconnaissance in 2015 of the wooded property west of the Site (MAA property), standing water and a drainage ditch, which ultimately flowed away from the Site to the west toward the railroad tracks, was observed. While standing water was observed in some areas, a strong flow was observed in the area of the railroad tracks. A small potential ditch was observed running west away from the former wash pad, ultimately connecting to the area of standing water. No pipes or drains were observed during the reconnaissance (Louis Berger, August 2015).

During the Supplemental Data Gap Investigation (2016-2017), no drainage ditch was observed on the MAA property as previously observed in 2015. Near well MW-9, standing water was observed following heavy rainfall. This area is lower in elevation than the surrounding area. There were no surface water bodies observed on the OMS #28, MAA, or nearby private properties during the 2016-2017 investigation activities.

2.4 PHYSIOGRAPHY

Mobile lies within the Coastal Plain physiographic province. It is further categorized within the East Gulf Coastal Plain within the Mississippi-Alabama continental shelf province. The Mississippi-Alabama continental shelf province encompasses the eastern Louisiana barrier islands and shelf, the Mississippi-Alabama barrier islands and shelf, Mississippi Sound, and Mobile Bay (Kindinger et al, 1994). This portion of the continental shelf is characterized by a complex network of paleovalleys that feed numerous deltas across the area (Greene, et al, 2007).

Mobile Bay is a fluvial valley incised during the Pleistocene and filled with deposits during the Holocene sea level rise, resulting in a low-energy, wave-dominated, microtidal estuary. The westward-prograding Holocene spit at the mouth of Mobile Bay has restricted the circulation of marine water and allowed the

valley to fill primarily with relatively thick lagoonal/estuarine deposits. At the northern end of the bay, delta-front deposits have encroached into the bay where the Mobile and Tombigbee Rivers have produced bay-head deltas. Mobile Bay is a highly complex environment with a mix of fluvial, estuarine, and marine sands (Kindinger et al, 1994).

Mobile and Baldwin counties comprise three physiographic districts: Southern Pine Hills, Alluvial-Deltaic Plain, and Coastal Lowlands (**Figure 2-2**) (Gillett, et al, February 2000). The city of Mobile is within the Alluvial-Deltaic Plain physiographic district. The Alluvial-Deltaic Plain physiographic district consists of alluvial and terrace deposits along the larger rivers such as the Mobile River (Gillett, et al, February 2000). The OMS #28 Site is within the Coastal Lowlands physiographic district near the border of the Alluvial-Deltaic Plain physiographic district. The Coastal Lowlands physiographic district is characterized by flat to gently undulating locally swampy plains underlain by deposits eroded from land (Gillett, et al, February 2000). Given the location of the OMS #28 Site, it is likely that there are characteristics of both physiographic districts.

2.5 REGIONAL STRATIGRAPHY

The geologic units exposed in Mobile County are of Tertiary to Quaternary age and consist chiefly of sand, gravel, silt, clay, and sandstone (Reed, July 1971). The Tertiary sedimentary deposits are generally unconsolidated. Alluvial, coastal, and terrace deposits of Quaternary age overlie Tertiary deposits in and adjacent to the flood plains of the larger streams and river and along the coastal areas of Mobile Bay (Gillett, et al, February 2000). **Figure 2-3** provides a geologic map of the area..

The source of recharge to the aquifers is through rainfall. The average annual rainfall in Mobile is 66 inches per year (U.S. Climate Data, August 2018).

Locally, there are two main aquifers are present in Mobile County, the Miocene-Pliocene aquifer and the Watercourse aquifer. The Miocene-Pliocene aquifer is of the Miocene and Pliocene series within the Tertiary period and is comprised of the Miocene series undifferentiated sediment and the Citronelle formation. The Watercourse aquifer is of the Pleistocene and Holocene series within the Quaternary period and is comprised on the high terrace deposits and the alluvium, coastal and low terrace deposits.

Regionally, the United States Geological Survey (USGS) has combined the Watercouse aquifer and the Miocene-Pliocene aquifer into one unit, the Sand and Gravel Surficial aquifer, as there is no confining unit that separates the two local aquifers (Miller, 1990). In general, the Sand and Gravel aquifer it is a thick sequence of coarse clastic rock that yields moderate volumes of water. The aquifer consists largely of interbedded layers of coarse sand and gravel that were deposited by streams. Thin clay beds in the Sand and Gravel aquifer locally create semi-confined conditions. The thickness in the Mobile Bay area is between 800 feet to greater than 1200 feet (Miller, 1990).

Water enters the Sand and Gravel aquifer as recharge from precipitation and moves generally downward, then either discharges to streams or moves coastward in the aquifer. Water movement in the upper zone of the aquifer is complex because this zone contains numerous discontinuous clay layers and some layers of iron oxide (hardpan). Because of the low permeability of the hardpan and the clay, and the confined conditions they produce, perched water table conditions, artesian conditions, and true water table conditions can all exist in one area (Miller, 1990).

The following describes in more detail the two local aquifers that comprise the Sand and Gravel aquifer.

Miocene-Pliocene aquifer

The Miocene-Pliocene aquifer consists of the Miocene series undifferentiated sediments and the Citronelle formation. The Miocene series undifferentiated sediments consist of clastic sedimentary deposits of marine and estuarine origin and represent a transition from the calcareous platform facies of Florida to the fluvial siliciclastic facies of Mississippi and subsiding Gulf basin. Sediments are somewhat wedge-shaped, thickening and dipping southwest toward the Gulf of Mexico (Gillett, et al, February 2000). They are primarily laminated to thinly bedded clays, sands, and sandy clays. The Miocene series undifferentiated sediments range in thickness from 400 feet in the northern part of the county to 3,400 feet in the southern part, and consist of laminated to massive marine and estuarine deposits (Reed, July 1971). In the Miocene series, the Pensacola Clay provides the base of the Miocene-Pliocene aquifer and separates it from the Floridan aquifer beneath (Gillett, et al, February 2000). Permeability of this confining unit is so small that practically no water passes across (Miller, 1990). The Miocene series undifferentiated sediments contain the deeper freshwater aquifers of the Mobile and Baldwin counties (Gillett et al, February 2000).

The Citronelle formation consist of non-fossiliferous, fine to very coarse quartz sand, sandy clay, and clayey gravel of non-marine origin (Reed, July 1971). In many areas, lenses of sandy clay and clayey sand range in thickness from 5 to 15 feet and are interbedded with gravelly sand (Gillett, et al, February 2000). Sediments near the base of the Citronelle formation have high clay content, indicating that they were deposited in an estuarine environment, whereas overlying sediments were deposited by sediment-laden streams (Isphording and Lamb, 1971). The Citronelle formation caps high hills and ridges and is relatively thin in the northern parts of the county, but has an estimated thickness of 200 feet at Dauphin Island in the southern part of the county (Reed, July 1971).

Groundwater flows through the sand and gravel beds of the Miocene-Pliocene aquifer that are irregular in thickness and of limited lateral extent. The clay intervals between the sand units are aquitards because the clays are not laterally extensive enough to prevent downward movement, but they do provide they do provide semi-confinement to many of the deeper sand and gravel intervals (Gillett, et al, February 2000).

Watercourse aquifer

The Watercourse aquifer is hydraulically connected to the Miocene-Pliocene aquifer. It is comprised of the high terrace deposits of the Pleistocene and the alluvium, coastal, and low terrace deposits of the Pleistocene and Holocene. The high terrace deposits unconformably overlie the Citronelle Formation in the northeastern part of Mobile County. The deposits consist chiefly of fine- to coarse-grained sand that is gravelly in some areas, and sandy clay (Reed, July 1971). The maximum thickness of the high terrace deposits is 40 feet; however, the deposits are more typically 15 to 20 feet in thickness (Reed, July 1971).

The alluvial, coastal, and low terrace deposits consists of partly carbonaceous, locally fossiliferous, interbedded very fine- to coarse-grained sand, gravel, and clay. The alluvial deposits generally are less than 70 feet thick, except in the Mobile River basin where they are as much as 150 feet thick (Reed, July 1971). The alluvial, coastal, and low terrace deposits represent a complex beach, dune, lagoonal, estuarine, and deltaic depositional environments (Gillett, et al, February 2000). These sand and gravel beds represent buried channel deposits which are surrounded by silt and clay sediments similar to those being deposited on the present flood plain of the river (Gillett, et al, February 2000).

The individual buried channels of the Watercourse aquifer may be directly connected to the present channels of the Mobile River. The length of individual sand and gravel beds probably ranges from a few hundred to a few thousand feet. The aquifer is hydraulically connected to the underlying Miocene-Pliocene aquifer. The sand and gravel beds in the watercourse aquifer and those in the shallow depths of the Miocene-Pliocene aquifer are hydraulically connected to the land surface; therefore, these aquifers are considered unconfined. Discontinuous lenses of clay retard the vertical movement of water, but do not completely separate the sand units; therefore, the Watercourse aquifer locally provides recharge for the underlying Miocene-Pliocene aquifer (Gillett, et al, February 2000).

2.6 SITE STRATIGRAPHY

AECOM reviewed the geologic data and regional literature at ALARNG OMS 28 in Mobile, Alabama and developed two representation Site-wide cross sections to support development of a site-specific CSM. The cross section locations are provided in **Figure 2-4** and the cross sections are presented in **Figures 2-5 and 2-6**. The cross sections provide geologic context for groundwater and analytical data, and can be used as the framework upon which new and existing datasets (groundwater, analytical chemistry, geophysical data, etc.) can be analyzed to better understand groundwater flow-paths, contaminant transport, and storage zones.

The cross sections were developed using Environmental Sequence Stratigraphy (ESS). ESS incorporates the petroleum industries best practices (sequence stratigraphy and facies analysis) to examine subsurface data within the context of depositional environments. Shown for each boring log in the cross sections is either a graphical grain-size log (a vertical series of colored blocks, which correspond to boring log lithology) or a continuous geophysical curve (which corresponds to a Membrane Interface Probe [MIP]/Hydraulic Profiling Tool [HPT] electrical conductivity log). These graphical representations of vertical grain-size distribution were the basis for the correlations between data points on the cross sections.

The color-coded blocks correspond to the graphic grain-size scale as shown in the cross sections' keys. The width of the block increases with relative grain-size. Block color indicates the textural classification of sediment (e.g. yellow for sand, green for silt, blue for clay) as written in the field notes of the core logging geologist (see the cross section keys for further definition).

MIP/HPT electrical conductivity logs are a common proxy for grain-size. They typically are used as a correlation aide because repetitive spatially extensive trends in grain-size are easily identified visually when curves are examined along a given section. The HPT measures the pressure required to inject a flow of water into the soil. Therefore, high measurements typically indicate clay layers while lower readings generally indicate coarser grain-sizes.

The previously established general hydrostratigraphy at ALARNG OMS 28 consists of an upper sandy unit (shallow aquifer) and a lower sandy unit (lower aquifer) separated by a thick clay confining unit (**Figure 2-7**). The RI Report states that the upper sandy unit extends from approximately 5 feet bgs to depths ranging from 16 feet to 35 feet bgs and consists of medium-grained sands, silty sands, and clayey sands (SAIC, May 2013). Below the upper sandy unit, a stiff gray clay (confining unit) was encountered, which extends to a depth between 70 feet and 84 feet bgs in borings across the Site. Beneath the confining unit, a course-grained sand was encountered to a depth of 90 feet bgs followed by clayey sand

to a depth of 104 ft bgs (SAIC, May 2013). Sandy clay and silty clay were encountered from a depth of 104 ft bgs to 120 ft bgs, the termination depth of the exploratory boring.

In contrast to the site stratigraphy presented in the RI Report (SAIC, May 2013), ESS correlation beneath the Site within the upper sandy unit (shallow aquifer) reveals that the sediment consists of several phases of Bayhead delta mouth-bar progradation/retrogradation that are represented by three depositional sequences. These sequences were most likely caused by small changes in water elevation throughout Mobile Bay through time. Maximum Flooding Surfaces (Red Markers on cross sections) represent periods of elevated water level and localized flooding (retrogradation). As the muddiest intervals in the system, these Maximum Flooding Surfaces generally act as confining beds. Conversely, Sequence Boundaries (Purple Markers on cross sections) represent surfaces of exposure/erosion due to significant drops in water elevation. As the sandiest intervals in the system, these deposits represent significant mouth-bar progradation and tend to be highly transmissive.

In addition to demonstrating that several phases of Bayhead delta mouth-bar progradation/retrogradation exist within the shallow aquifer, the ESS cross sections also exhibit significant heterogeneity within these deposits. The sand-bodies (yellow on the cross sections) are interlaminated with thin, continuous clays (grey on the cross sections) and they also dip in many different directions, the product of local subsidence. Not only does subsidence play a significant role in groundwater flow directions, but it may have also created transmissive pathways for shallow contaminants to migrate deeper (For example, see MHP-09 or MHP-05 from W-E section **Figure 2-6**).

During the course of the Supplemental Data Gap Investigation, the upper sandy unit (shallow aquifer) was subdivided into the Upper Surficial, Middle Surficial, and Lower Surficial based on the EES. A detailed discussion of the separation within the shallow aquifer is provided in Section 4.1.2.

One of the most important benefits of ESS is to develop and refine the CSM. ESS provides a predictive framework for hydrostratigraphic units, but regional and local differences in sediment supply, depositional environment, and sea level affect the development of the hydrogeologic framework. Sequence stratigraphy allows packages of coarser sediments to be bracketed in a predictable manner by confining units. Facies analysis, coupled with depositional models, allows for the prediction of the potential scale and connectivity of coarser aquifer material. Sequence stratigraphy and facies analysis provides a means of roughly predicting permeability, porosity, and conductivity from aquifers, though exact estimates can only be achieved through hydraulic testing. However, understanding the sequence stratigraphy and depositional facies is critical for understanding scale and connectivity of aquifers and their confining units and predicting their local distributions.

2.7 ECOLOGY

The Mobile-Tensaw River Delta is Alabama's largest wetland ecosystem and the OMS #28 Site falls within the south-west portion of the delta. Key habitats within the Mobile-Tensaw River Delta include freshwater wetlands, bogs, bottomland hardwoods, freshwater and hardwood swamps, maritime forests, mesic flood plains, pine savannas, riparian buffers, submerged seagrass beds, tidal brackish water marshes, and waterways (The Mobile Bay National Estuary Program, August 2013).

The ecological community at OMS #28 consists of a forested area with a canopy of mainly oak trees as well as smaller trees, shrubs, grasses, and forbs in the understory. The diversity of vegetation and

habitats in this terrestrial community is limited, and the community is fragmented and separated from other, larger habitat areas. As a result, this area likely provides habitat for a limited fauna of wildlife species that typically are common in close proximity to development and human activity. Mammals that may occur in this community include the gray squirrel, eastern cottontail, opossum, southeastern shrew, and cotton mouse. Birds likely to utilize these habitats include the American robin, brown thrasher, mockingbird, cardinal, and Carolina wren. Reptiles that may be present include the gray rat snake, southern fence lizard, and green anole. Amphibians potentially occurring in this community include the gray frog and southern toad. There are no surface waters or aquatic communities near the Site.

2.8 POTENTIAL SOURCE AREAS

Following the detection of TCE at well MW-8 in March 2005, a comprehensive investigation at OMS #28 was initiated to determine the source of TCE in the groundwater. The previous investigations identified two potential sources of TCE groundwater contamination, one on ALARNG property and one on MAA property. In addition, one potential source of PCE groundwater contamination was identified on MAA property based on soil samples collected from April 2006 through March 2007 (**Figure 1-4**).

The potential source of TCE in groundwater was identified on ALARNG property through soil sampling around well MW-8, where a number of surface and/or subsurface samples exceeded the protection of groundwater SSL for TCE at the time of the RI (**Figure 1-4**). The second potential source of TCE in groundwater was identified during the installation of well MW-9, where the surface soil sample exceeded the protection of groundwater SSL for TCE.

The potential source for PCE was identified during soil sample collection at soil boring location B-17. In both the B-17 surface soil sample and the B-17 subsurface soil sample (8 to 10 feet bgs), PCE was detected above its protection of groundwater SSL.

3.0 GROUNDWATER MONITORING EVENTS

Groundwater monitoring completed for the data gap investigation occurred during two sampling events. The first sampling event occurred in January 2016 and the second in May 2017. Groundwater monitoring activities for these two events were completed in accordance with the UFP-QAPP (AECOM, January 2016) on groundwater well sampling. Only minor deviations from the QAPP were necessary due to Site conditions and they are described along with the investigation activities in the sections below.

3.1 GROUNDWATER MONITORING EVENT – JANUARY 2016

The January 2016 groundwater monitoring event was conducted from January 19 through 21 by AECOM field staff. Groundwater sampling locations are shown on **Figure 3-1**. Other activities completed during this sampling event included brush clearing for well and property access, well condition assessments, and the re-development of select wells prior to sampling activities.

3.1.1 Vegetation Clearing

Heavy brush was cleared to allow access to each monitoring well location and to clear room to conduct the field investigation activities for soil and groundwater, including limited clearing around wells to gain access for sampling. The fence line around the OMS #28 and the MAA property where the investigation took place was also cleared. Approximately 1.95 acres were cleared. A skid-steer with forestry mulcher was used to remove the vegetation. Grasses and soft vegetation were flattened and woody vegetation, such as trees and shrubs, were shredded or chipped and spread onsite. The large permanent trees were not cleared.

3.1.2 Well Condition Assessment

During the January 2016 groundwater sampling event, the field team recorded the physical condition of each well on Well Maintenance Forms. The completed Well Maintenance Forms and photographs of each well are provided in **Appendix A** (**A1**). A summary of the well condition assessment is provided as **Table 3-1**. In general, wells were found without well tags and several wells did not have protective metals casings around the PVC stickup casing; however, most wells were usable and able to be sampled. Two wells were found damaged, MW-8 and OMS-28-6. These wells were found buried under approximately one- to two feet of crusher run. Employees at the OMS #28 facility helped to uncover the wells with an excavator. After excavation, monitoring well MW-8 was found with the casing bent below the ground surface. The well was able to be sampled; however, depth to water could not be accurately measured. Well OMS-28-6 was found destroyed after being uncovered by the excavator. PVC with a slip cap was found loosely in the ground were the OMS-28-6 once was, surrounded by the remaining grout column. The PVC was lifted out of the hole and the hole was measured to approximately 9-feet bgs.

3.1.3 Well Development

In accordance with the UFP-QAPP (AECOM, January 2016), monitoring wells MW-8, OMS-28-6, OMS-28-7, OMS-28-1, and MW-12 were measured for total depth prior to initiating sampling activities to determine if there was sediment in the bottom of the wells that needed to be removed. All wells were found with no excessive sediment in the bottom with the exception of well MW-8, which was found buried under one- to two-feet of crusher run. To remove the sediment, well MW-8 was redeveloped by pumping and surging the well as much as possible. This had to be completed using a peristaltic pump since MW-8

had a bent casing. The redevelopment of MW-8 was continued until the turbidity of the water was below 10 NTUs. Following this process, the rate of pumping was reduced to that of low-flow groundwater sampling. During development, field parameters (water temperature, pH, oxidation-reduction parameter, specific conductivity, and turbidity) were measured until stability was achieved. The well development log for well MW-8 is provided in **Appendix A (A2)**. No other wells were in need of re-development.

3.1.4 Water Level Event

Ten monitoring wells were gauged on January 19, 2016, to assess static groundwater elevations and determine groundwater flow directions. Well OMS-28-6 was not gauged because it was found destroyed (see Section 3.1.2) and well MW-8 was gauged only during groundwater sampling to calculate well volume. Monitoring well MW-8 was found with a bent casing; therefore, the groundwater elevation cannot be accurately calculated because the top of casing elevation is no longer valid. The remaining water levels were collected in accordance with the UFP-QAPP (AECOM, January 2016). Depth to water and calculated groundwater elevations are reported in **Table 3-2**.

In January 2016, the groundwater elevation in the shallow aquifer ranged from 20.61 feet above mean seal level (msl) at well MW-12 to 24.72 feet above msl at well MW-9. Groundwater elevation in the deep zone screened below a confining clay unit was 4.17 feet above msl at well OMS-28-1 and 2.09 feet above msl at well OMS-28-4. In general, these groundwater elevations were consistent with previous gauging events.

A groundwater elevation map of the shallow aquifer is depicted on **Figure 3-2** based on the January 2016 water elevations of the eight gauged wells screened in the shallow zone. Based on the groundwater elevation contours and apparent flow directions, there appears to be a local trough feature running north-south between well OMS-28-5 and area west of well OMS-28-7, with groundwater converging from each side before flowing northward.

3.1.5 Analytical Results

During the January 2016 groundwater monitoring event, 11 of the planned 12 wells were sampled to evaluate concentrations of chlorinated solvents. All wells associated with Site OMS #28 were sampled with the exception of well OMS-28-6. As discussed in Section 3.1.2 Well Condition Assessment, well OMS-28-6 could not be sampled because it was found buried under crusher run and destroyed. Well MW-8 was also found under the crusher run with a bent casing; however, tubing could be inserted for sampling. The monitoring wells were purged and sampled in accordance with the UFP-QAPP (AECOM, January 2016).

Field parameters were measured during purging, and groundwater samples were analyzed for VOCs by USEPA Method 8260B by Gulf Coast Analytical Laboratories (GCAL). The field parameters are provided on the groundwater sampling logs provided in **Appendix A (A3)**. A summary of the groundwater analytical results for the January 2016 sampling event is presented in **Table 3-3**. The laboratory data packages are presented in **Appendix B (B1** and **B2)**. The limited data validation report (DVR) for the January 2016 sampling event is provided in **Appendix C (C1)**.

Data were compared to the USEPA MCLs (USEPA, March 2018). If there was not a MCL, the USEPA Regional Screening Level (RSL) for tap water, based on a risk of 10^{-6} for carcinogens and HQ of 0.1 for noncarcinogens (USEPA, May 2018), was used. Exceedances of chemicals of concern (COCs; i.e., PCE

and TCE) and their daughter products (i.e., cis-1,2-DCE and vinyl chloride) in groundwater are discussed below.

PCE

In the shallow aquifer, PCE exceeded its MCL in the sample from one well, OMS-28-5 (**Table 3-3; Figure 3-1**). Historically, PCE has only been detected above the MCL at this well (**Table 3-4**). PCE was not detected above the limit of detection (LOD) in any other sample from the shallow aquifer wells. In the deep aquifer zone, PCE was detected at a low, estimated concentration in well OMS-28-4 during the January 2016 sampling event (**Table 3-3; Figure 3-1**). Historically, PCE has not been detected at this location above the LOD (**Table 3-4**). PCE was not detected at or above the LOD in the other deep aquifer zone well (OMS-28-1) during the January 2016 sampling event (**Table 3-3**).

TCE

In the shallow aquifer, TCE concentrations exceeded the MCL in samples from monitoring wells MW-8, OMS-28-3, and OMS-28-5 (**Table 3-3; Figure 3-1**). Historically, TCE has exceeded its MCL in samples from these wells only (**Table 3-4**). Well MW-8 initially had the highest concentration of TCE; however, based on the January 2016 results, the highest concentration of TCE is currently in well OMS-28-5. The increase in concentration at well OMS-28-5 may be from PCE degradation at well OMS-28-5, from downgradient flow from wells MW-8 and OMS-28-3, which are upgradient of well OMS-28-5, or from a combination of both (**Figure 3-1**). In the deep aquifer zone, TCE was not detected at or above the LOD during the January 2016 sampling event (**Table 3-3**).

Cis-1,2-DCE

Cis-1,2-DCE is a degradation product of TCE and, ultimately, PCE. It is being monitored to determine if degradation is occurring in the groundwater environment. During the January 2016 sampling event, cis-1,2-DCE concentrations did not exceeded the MCL in any samples from the shallow aquifer unit (**Table 3-3; Figure 3-1**). In the two wells where concentrations of cis-1,2-DCE were detected (OMS-28-3 and OMS-28-5), TCE was also detected, (**Table 3-4**). In the deep aquifer zone, cis-1,2-DCE was not detected during the January 2016 sampling event (**Table 3-3**).

Vinyl Chloride

Vinyl chloride is a daughter product of cis-1,2-DCE in the chlorinated degradation chain of PCE and TCE. During the January 2016 sampling event, vinyl chloride was not detected at a concentration greater than the LOD in any of the shallow or deep aquifer zone wells sampled (**Table 3-3; Figure 3-1**). Historically, vinyl chloride concentrations have not been detected at the sample quantitation limit or have been below the MCL in all shallow and deep aquifer zone monitoring wells (**Table 3-4**).

3.1.6 Data Quality

In accordance with the UFP-QAPP Amendment (AECOM, January 2016), GCAL in Baton Rouge, Louisiana conducted the chemical analyses for groundwater samples. AECOM performed intra-organizational quality control (QC) checks of field and laboratory procedures used in collecting and analyzing the data. The QC checks verified the data collected were of appropriate quality for the intended data use. No QC excursions were encountered during the validation of this data set (see **Appendix C-1**).

One field duplicate sample was collected to determine the precision of the analytical method. The relative percent difference (RPD) was calculated where detections occurred without data flags. All RPD results for the duplicate sample calculations were below the maximum acceptable level of 35 percent for VOCs. The results of the RPD calculations are provided in the data validation report provided in **Appendix C** (**C1**).

Trip blanks were also used for all sample shipments during the monitoring event. A trip blank is associated with each day's shipment of VOCs, with one trip blank per cooler containing VOCs samples. A trip blank is used to assess the possibility of cross contamination of VOCs during shipment. Two trip blanks were used during the sampling event. The trip blank samples were free of target analyte contamination (**Appendix C1**).

One matrix spike/matrix spike duplicate (MS/MSD) sample was collected during the January 2016 sampling event. The MS/MSD sample is used to document the bias of a method due to sample matrix. The performance of the MS/MSD is evaluated against the QC acceptable limits for the purposes of data validation only. If either the MS or the MSD were outside the QC acceptance limits, the analytes in all related samples would be qualified with a data flag. During the January 2016 sampling event, no sample results were qualified with MS or MSD data flags.

3.2 GROUNDWATER MONIORING RESULTS – MAY 2017

The May 2017 groundwater monitoring event was conducted from May 1 through 5 by AECOM field staff. Groundwater sampling locations are shown on **Figure 3-1**. In addition to the well sampling event, a water level event was also conducted to support calculation of groundwater elevations and flow directions.

3.2.1 Water Level Event

Ten monitoring wells were gauged on May 1, 2017, to assess static groundwater elevations and determine groundwater flow directions. Well OMS-28-6 was not gauged because it was found destroyed (see Section 3.1.2) and well MW-8 was gauged only during groundwater sampling to calculate well volume. Well MW-8 was found with a bent casing; therefore, the groundwater elevation cannot be calculated because the top of casing elevation is no longer valid. The remaining water levels were collected in accordance with the UFP-QAPP (AECOM, January 2016). Depth to water and calculated groundwater elevations are reported in **Table 3-2**.

Groundwater elevation in the shallow aquifer ranged from 20.06 feet above msl at well OMS-28-5 to 24.25 feet above msl at well MW-9. Groundwater elevation in the deep zone screened below a confining clay unit was 3.83 feet above msl at well OMS-28-1 and 1.73 feet above msl at well OMS-28-4. In general, these groundwater elevations were consistent with previous gauging events.

A groundwater elevation map of the shallow aquifer is depicted on **Figure 3-3** based on the May 2017 water elevations of the eight gauged wells screened in the shallow aquifer. The apparent groundwater flow directions are similar to the January 2016 flow directions. The flow pattern at the Site appears to be dominated by a local trough feature running north-south between well OMS-28-5 and area west of well OMS-28-7 with groundwater flow converging from each side before turning northward.

3.2.2 Analytical Results

During the May 2017 groundwater monitoring event, 11 of the planned 12 wells were sampled to evaluate concentrations of chlorinated solvents. All wells associated with Site OMS #28 were sampled with the exception of well OMS-28-6. As discussed in Section 3.1.2, well OMS-28-6 could not be sampled because it was found destroyed. Well MW-8 was also found under the crusher run with a bent casing; however, tubing could be inserted for sampling. The monitoring wells were purged and sampled in accordance with the UFP-QAPP (AECOM, January 2016).

Field parameters were measured during purging, and groundwater samples were analyzed for VOCs by USEPA Method 8260B by GCAL. The field parameters are provided on the groundwater sampling log provided in **Appendix A (A4)**. A summary of the groundwater analytical results for the May 2017 sampling event is presented in **Table 3-3**. The laboratory data package is presented in **Appendix B (B3)** and the limited DVR for the May 2017 sampling event is provided in **Appendix C (C2)**.

Data were compared to the USEPA MCLs (USEPA, March 2018). If there was not a MCL, the USEPA RSL for tap water (USEPA, May 2018), which is based on a risk of 10^{-6} for carcinogens and HQ of 0.1 for noncarcinogens, was used. Exceedances of Site COCs and their daughter products in groundwater are discussed below.

PCE

In the shallow aquifer, PCE exceeded its MCL in one sample from well OMS-28-5 (**Table 3-3; Figure 3-1**). Historically, PCE has only been detected above the MCL at this well (**Table 3-4**). PCE was not detected above the LOD in any other sample from monitoring wells screened in the shallow aquifer. In the deep aquifer zone, PCE was not detected during the May 2017 sampling event (**Table 3-3; Figure 3-1**). Historically, PCE has not been detected above the MCL in any deep aquifer zone monitoring well (**Table 3-4**).

TCE

In the shallow aquifer, detected concentrations of TCE exceeded the MCL in samples from monitoring wells OMS-28-3 and OMS-28-5 (**Table 3-3; Figure 3-1**). Historically, TCE has exceeded its MCL in samples from wells MW-8, OMS-28-3, and OMS-28-5 only (**Table 3-4**). In May 2017, the TCE concentration in the sample from MW-8 was a low, estimated concentration below the MCL. Well MW-8 initially had the highest concentration of TCE; however, based on the May 2017 results, the highest concentration of TCE is currently at well OMS-28-5. The increase in concentration at well OMS-28-5 may be the result of PCE degradation at OMS-28-5, from downgradient flow from wells MW-8 and OMS-28-3, which are upgradient of well OMS-28-5, or from a combination of both (**Figure 3-1**). In the deep aquifer zone, TCE was not detected during the May 2017 sampling event (**Table 3-3**).

Cis-1,2-DCE

Cis-1,2-DCE is a degradation product of TCE and, ultimately, PCE. It is being monitored to determine if degradation is occurring in the groundwater environment. During the May 2017 sampling event, the cis-1,2-DCE concentration in one sample from well OMS-28-5 in the shallow aquifer zone exceeded its MCL (**Table 3-3; Figure 3-1**). Cis-1,2-DCE was detected in only one other shallow well in May 2017, OMS-28-3. At both wells where cis-1,2-DCE was detected, TCE was also detected (**Table 3-4**). In the deep

aquifer zone, cis-1,2-DCE was not detected in any samples collected during the May 2017 sampling event (**Table 3-3**).

Vinyl Chloride

Vinyl chloride is a daughter product of cis-1,2-DCE in the chlorinated degradation chain of PCE and TCE. During the May 2017 sampling event, vinyl chloride was not detected at a concentration greater than the LOD in any of the shallow or deep aquifer zone monitoring wells sampled (**Table 3-3; Figure 3-1**). Historically, vinyl chloride concentrations have not been detected or have been below the MCL in both the shallow and deep aquifer zone monitoring wells (**Table 3-4**).

3.2.3 Data Quality

In accordance with the UFP-QAPP (AECOM, January 2016), GCAL in Baton Rouge, Louisiana conducted the chemical analyses for groundwater samples. AECOM performed intra-organizational QC checks of field and laboratory procedures used in collecting and analyzing the data. The QC checks verified the data collected were of appropriate quality for the intended data use. No QC excursions were encountered during the validation of this data set (see **Appendix C2**).

One field duplicate sample was collected to determine the precision of the analytical method. The RPD was calculated where detections occurred without data flags. All RPD results for the duplicate sample calculations were below the maximum acceptable level of 35 percent for VOCs. The results of the RPD calculations are provided in the DVR provided in **Appendix C** (**C2**). Note that well sampling during the May 2017 event occurred concurrently with discrete groundwater sampling (Section 4.0) during May and June 2017 and these data are also included in the DVR report.

Trip blanks were also used for all sample shipments during the monitoring event. A trip blank is associated with each day's shipment of VOCs, with one trip blank per cooler containing VOCs samples. A trip blank is used to assess the possibility of cross contamination of VOCs during shipment. One trip blank was used during the sampling event. The trip blank sample was free of target analyte contamination (**Appendix C2**).

One MS/MSD sample was collected during the May 2017 sampling event. The MS/MSD sample is used to document the bias of a method due to sample matrix. The performance of the MS/MSD is evaluated against the QC acceptable limits for the purposes of data validation only. If either the MS or the MSD were outside the QC acceptance limits, the analytes in all related samples would be qualified with a data flag. During the May 2017 sampling event, no sample results were qualified with MS or MSD data flags.

3.3 IDW MANAGEMENT

During the January 2016 sampling event, two drums of purge water were generated from groundwater sampling activities. During the May 2017 sampling event, seven drums of aqueous investigation-derived waste (IDW) were generated by a combination of purge water from groundwater sampling activities and purge and decontamination water from data gap investigation activities (see Section 4.0). The IDW was stored in 55-gallon drums. The drums were transported on August 8, 2017 by Horizon Environmental Services, LLC. Analytical data generated during the sampling events were submitted to Horizon Environmental Services, LLC and determined that the aqueous IDW was non-hazardous. Horizon

Environmental Services, LLC disposed of the nine aqueous drums of IDW as non-hazardous waste. The manifest is provided in **Appendix D** (**D1**).

4.0 DATA GAP INVESTIGATION

In 2014, the FS recommended the alternative Biological/Chemical Reduction of Groundwater with Excavation of Source Soils as the preferred alternative. This alternative includes the excavation of an area of soil (approximately 70 ft by 80 ft) surrounding monitoring wells OMS-28-6 and MW-8, as well as an area of soil (approximately 20 ft by 20 ft) surrounding borehole location B-17. The excavation depths are designed to extend vertically from the ground surface to the water table (approximately 15 ft bgs) (**Figure 1-4**). These areas were determined to exceed the protection of groundwater soil screening levels for PCE and/or TCE. This alternative also includes the treatment of groundwater with amendments to promote enhanced reductive dechlorination of Site-related chlorinated solvents.

As discussed in Section 1.1, the main purpose of this investigation was to refine the CSM within the shallow zone to aide in the design and implementation of the selected remedy. The objectives of this Supplemental Data Gap Investigation were to conduct an investigation to identify if other soil source areas were contributing to groundwater contamination and to improve the delineation of the known groundwater contaminant plume.

The investigation contained three parts to meet these objectives:

- Subsurface investigation using a MIP and HPT,
- Soil sampling via direct push technology (DPT), and
- Discrete groundwater sampling via DPT.

Figure 4-1 presents a location map of all data gap investigation sample locations.

4.1 MIP / HPT

The MIP and HPT work were conducted by Columbia Technologies between April 10 and 14, 2017. Multiple probes were used during the investigation. Boreholes were investigated using a MIP, HPT, and a combination of both tools in one probe (MHP). The locations of the MIP, HPT, MHP locations are provided on **Figure 4-1**.

4.1.1 Methods

Several probes or tools were used in the investigation: electrical conductivity (EC), MIP, HPT, photo ionization (PID), and halogen-specific detector (XSD). A description of each is provided as follows:

- The EC continuously measures soil electrical conductivity. In general lower conductivity values are characteristic of larger grain-size soil types, while higher conductivities are characteristic of finer sized particles, such as finer sand silts, and clays.
- MIP continuously measures total chemical detector response to VOCs verses depth. The MIP was used in saturated and unsaturated soils. At OMS #28, Low Level MIP (LLMIP) was used to increase the sensitivity of the MIP logging tool.
- HPT continuously measures the hydraulic conductivity of the soil by injecting the constant flow of water through a small stainless steel screen into the soil formation and measuring the hydraulic pressure at both the pump source and the injection port verses depth. The HPT software can also provide an estimate of hydraulic conductivity (K) to provide an interpretation of the hydraulic permeability of the formation.

- The PID consists of a special ultraviolet lamp that emits a response for chlorinated compounds containing double-bonded carbons such as TCE and PCE.
- The XSD consists of a ceramic probe, platinum wire (anode), and platinum bead (cathode) mounted inside a high-temperature reactor. The XSD is sensitive and provides a linear response to the quantity of halogen (e.g. TCE and PCE).

A DPT rig was used to carry the probes to the target depths. The top of the lower clay, initially estimated at 30-ft bgs, was the targeted termination depth for each point. Twenty (20) points were completed with MIP, HPT, or MHP. The total depths of the 20 points ranged from 32.7 ft bgs to 50.6 ft bgs (**Table 4-1**).

4.1.2 Findings

The results of the MIP/HPT investigation are presented in **Appendix E**. MIP locations were strategically placed to help determine if additional sources were present that were contributing to the groundwater plumes as understood prior to this investigation, and these locations are shown on **Figure 4-1**. Specifically, investigation borings were located in the vicinity of the former pollution control system and the former washpad, shown on Figure 1-3, and the proposed soil excavation area within the plume boundary near soil boring B-17 (**Figure 1-4**). Results of the MIP/HPT investigation related to the evaluation of potential source areas are as follows:

- Along the former pollution control system, responses from the XSD were minimal and nearly no different from background. A response in the PID was identified in the top 3-feet and between 7 to 10 feet at MIP-08 and MIP-09. At MIP-07, a PID response was also indicated from 3- to 8-feet bgs. With the lack of a corresponding XSD response in the associated logs, the PID response may indicate the presence of organic matter and not that of chlorinated solvents.
- At the former washpad and identified soil excavation area around well MW-8, responses from the XSD were identified between 15 and 21 feet. This depth range is below the water table and is indicative impacted groundwater rather than a possible additional source.
- Within the plume, specifically in the area of the known PCE plume from 2010 (soil boring B-17, **Figure 1-4**), a response from the XSD was noted from 15 to 18 feet bgs. This depth range is below the water table and is indicative of impacted groundwater rather than a possible additional source.

Additional locations, MIP-02 and MIP-03, were also investigated to determine if a source might be present near other wells that have shown high concentrations of TCE and/or PCE. At MIP-02, near well OMS-28-3, a response from the XSD between 13 and 15 feet bgs was recorded. This depth range is below the water table indicating impacted groundwater instead of a possible additional source in the soil contributing the groundwater contamination.

Location MIP-03 was east of MIP-04 and within the 2010 PCE plume footprint. Between 7 and 14 feet bgs, a response from the XSD was recorded. However, like at location MIP-02, this response was located within the smear zone and water table, indicating impacted groundwater instead of a possible additional source in the soil.

The HPT investigation results aided in the development of the ESS discussed in Section 2.6 and were used to help guide the selection of sample depths for the discrete groundwater sampling event, targeting sands within the shallow zone for groundwater sampling. HPT was utilized to record responses at 11

locations, in addition to the 9 MIP locations. Utilizing the HPT data, two coarse-grained zones were observed at most locations within the shallow upper sandy zone. In the EC log and corresponding HPT pressure average, a lower response indicates a coarser-grained material while a higher response indicates a finer-grained material. Two zones of coarse-grained material were routinely visible within the shallow upper sandy zone prior to reaching what was believed to be the thick clay confining unit identified in the cross section from the RI (SAIC, May 2013), which is included as **Figure 2-7**. The sand zones identified with the HPT are generally only a few feet thick and, in most cases, still contain fine-grained material. Utilizing the HPT data, the shallow aquifer zone could be divided into three zones:

- Upper surficial, extending from the water table, ranging in depth from approximately 6 to 13 feet bgs, and typically comprised of fine-grained material without any significant coarse-grained zones;
- Middle surficial, indicated by the first coarse-grained material zone, approximately 4-to 6-feet thick, and encountered between 12 and 26 feet bgs; and
- Lower surficial, which sits on the top of the thick clay confining unit identified during the RI that separates the Shallow aquifer from the Deep aquifer, indicated by the second coarse-grained material zone, approximately 3 to 5 feet thick, and encountered greater than 26 feet bgs.

Based on the EES discussed in Section 2.6, the zones of coarse material identified on the EC log are made up of thin, discontinues lenses of alternating sands and clay/silt material.

4.2 SOIL SAMPLING

Based on the results of the MIP investigation and results of previous soil sampling conducted in 2006 and 2007, additional soil samples were collected as part of the supplemental data gap investigation.

4.2.1 Methods

Continuous soil cores were collected via DPT in accordance with the UFP-QAPP (AECOM, January 2016). The soil was screened at 2-foot intervals with a PID. For each soil boring, samples were collected at three depths: surface soil (0-1 foot), upper subsurface soil (of the sample interval with the highest VOC concentration as identified with the MIP or PID), and a lower subsurface zone (1-foot above the soil/water interface). The soil/water interface was generally encountered between 4 to 7 feet bgs. Soil samples were collected at the bottom of each sample interval utilizing TerraCore® sampling sets to minimize the release of volatiles from the sample. The locations of the soil boring are presented in **Figure 4-1**.

The soil samples were analyzed for TCE and PCE via USEPA Method SW8260B by the on-site mobile laboratory, Columbia Technology, LLC. As a quality check, split samples were collected at a frequency of 10% of total soil samples and sent to an off-site fixed laboratory, GCAL, for analysis of a target compound list (TCL) of VOCs by USEPA Method SW8260B. Field duplicate samples (10% frequency), MS/MSD samples (5% frequency), and equipment blanks (% frequency) were also collected and were analyzed at the on-site mobile laboratory. Field duplicates and MS/MSD samples were collected for the off-site fixed laboratory at 10% and 5% frequency, respectively, of split samples.

Soil locations within the residential property (Parcel R022911360003106) were not originally planned as part of the initial soil sampling as described in the UFP-QAPP (AECOM, January 2016). These locations (i.e., SB23 through SB31) were added in the field based on the results of TCE and PCE at discrete groundwater sampling location OMS-28-GW22 (discussed in Section 4.3). The groundwater results of

PCE and TCE at this location indicated that a possible soil source might be present; therefore, additional soil samples were added to define the area. The discrete groundwater results are discussed in Section 4.3.

4.2.2 Results

Ninety-three (93) soil samples were collected and analyzed from 31 boring locations. Soil sampling logs are provided in **Appendix A** (**A5**). The on-site mobile laboratory analytical results are presented as **Table 4-2** and are screened against the residential soil screening level (SSL), industrial SSL, and the MCL-based protection of groundwater SSL from the USEPA RSL Table (USEPA, May 2018). A summary of the concentrations for detected VOCs in the split samples from the off-site fixed laboratory are presented in **Table 4-3** and are screened in the same manner as the results from the on-site mobile laboratory. **Figures 4-3 through 4-5** depict the results of soil samples that were analyzed by the mobile laboratory and exceed the soil screening criteria for TCE and/or PCE. The laboratory report for data analyzed by the mobile laboratory is included in **Appendix B** (**B6**) and the DVR is provided in **Appendix C** (**C2**).

Soil samples collected within the extent of the ALARNG facility's boundaries during the data gap investigation did not result in TCE or PCE concentrations above laboratory detection limits for any of the sample depths.

Surface Soil (0-1 foot)

Surface soil samples were collected from the bottom of the 0-1 foot interval. **Table 4-2** provides the analytical results from the on-site mobile laboratory for PCE and TCE and **Figure 4-3** shows the surface soil locations and PCE/TCE concentrations exceeding either the residential or the industrial RSLs for these locations.

On MAA Property, near the adjacent residential property (Parcel R022911360003106), two soil boring locations (OMS-28-SB18 and OMS-28-SB19) had detections of PCE above the MCL-based protection of groundwater SSL (0.0023 milligrams per kilogram [mg/kg]); however, TCE concentrations at these locations were below laboratory detection limits.

Soils samples collected from six soil boring locations (OMS-28-SB24, -SB25, -SB28, -SB29, -SB30, and -SB31) on the off-site residential property (Parcel R022911360003106) resulted in concentrations of PCE and/or TCE that exceeded screening criteria. One location, OMS-28-SB24, had a concentration of PCE exceeding the industrial RSL (39 mg/kg; USEPA, May 2018) and three locations (OMS-28-SB29, -SB30, and -SB31) had a concentration of PCE exceeding the residential RSL (8.1 mg/kg; USEPA, May 2018). Two locations (OMS-28SB25 and –SB28) had concentrations of PCE exceeding the MCL-based protection of groundwater SSL (0.0023 mg/kg; USEPA, May 2018). Soil samples from three locations within the residential property had concentrations of TCE above the MCL-based protection of groundwater SSL (0.0018 mg/kg; USEPA, May 2018), OMW-28-29, OMS-28-SB30 and OMS-28-SB31. Detected TCE and PCE concentrations were below laboratory detection limits or were low, estimated values below the screening levels in all other surface soil samples collected.

Upper Subsurface Soil (varying depths between 1.5 and 4 feet bgs)

The upper subsurface soil was selected based on one of three criteria. First, if a MIP result indicated a potential soil contamination, a sample was collected. Second, if no MIP result was present or a MIP

boring was not collected near the soil boring location, the interval with the highest PID reading was selected. Third, if there was no MIP or PID response, the sample was collected half way between the ground surface and the water table. **Table 4-2** provides the analytical results from the on-site mobile laboratory for PCE and TCE and **Figure 4-4** shows the upper subsurface soil locations and PCE/TCE concentrations exceeding the residential RSLs and MCL-based protection of groundwater SSL for these locations. No samples had TCE or PCE concentrations exceeding the industrial RSLs.

On MAA Property, near the adjacent residential property (Parcel R022911360003106), one soil boring location, OMS-28-SB18, had a detection of PCE above the MCL-based protection of groundwater SSL (0.0023 mg/kg); however, TCE was not detected at a concentration above the laboratory detection limit. This sample depth was selected based on the highest PID result.

Soils samples collected from five soil boring locations (OMS-28-SB24, -SB28, -SB29, -SB30, and -SB31) on the off-site residential property (Parcel R022911360003106) had detected concentrations of PCE and/or TCE that exceeded the residential RSL or MCL-based protection of groundwater SSL (USEPA, May 2018). One location, OMS-28-SB24, had a concentration of PCE exceeding the residential RSL (8.1 mg/kg; USEPA, May 2018). The other four locations (OMS-28-SB28, -SB29, -SB30, and –SB31) had concentrations of TCE and PCE exceeding their respective MCL-based protection of groundwater SSL (USEPA, May 2018). Detected TCE and PCE concentrations were below the laboratory detection limits or were at low, estimated concentrations below screening values for all other upper subsurface soil samples.

Lower Subsurface Soil (1-foot above the water table)

The deepest subsurface soil samples were collected 1-foot above the water table at each sample location. The water table was either determined by the depth of water at nearby wells or based on visual inspection of the soil core. **Table 4-2** provides the analytical results from the on-site mobile laboratory for PCE and TCE and **Figure 4-5** shows the lower subsurface soil locations and PCE/TCE concentrations exceeding the MCL-based protection of groundwater SSL for these locations. No lower subsurface soil samples had detected concentrations of TCE or PCE that exceeded the residential or industrial RSLs.

On MAA Property, near the adjacent residential property (Parcel R022911360003106), one soil boring location, OMS-28-SB19, had a detected concentration of PCE and TCE above their respective MCL-based protection of groundwater SSL (0.0023 mg/kg and 0.0018 mg/kg, respectively). The surface soil concentration of PCE at soil boring OMS-28-SB19 also had a detected concentration of PCE that exceeded the MCL-based protection of groundwater SSL; however, TCE concentrations were not detected above the laboratory detection limits in the surface soil and upper subsurface soil samples from this location.

Soils samples collected from seven soil boring locations (OMS-28-SB24, -SB25, -SB27, -SB28, -SB29, -SB30, and -SB31) on the off-site residential property (Parcel R022911360003106) exhibited exceedances of PCE above the MCL-based protection of groundwater SSL. TCE and PCE concentrations at all other lower surficial soil sample locations were below the laboratory detection limit or were at low, estimated concentrations below the screening criteria.

Split Samples

Soil split sample results, which were analyzed for TCL VOCs, detected methylene chloride (MC) above its MCL-based protection of groundwater SSL (0.0013 mg/kg) in six soil samples (**Table 4-5**). These results did not exceed the residential or industrial SSLs for MC (35 mg/kg and 320 mg/kg, respectively). Soil split sample results for soil boring OMS-28-SB-24, at all three depth intervals (1, 3, and 5-feet bgs, respectively), reported a PCE concentration that exceeded either the industrial or the residential RSL. At the 5-foot depth, the concentration of PCE exceeded the residential RSL (8.1 mg/kg) and at the 1-foot and 3-foot depths, the PCE concentrations exceeded the industrial RSL (39 mg/kg). The PCE results in these 3 split samples are higher than the corresponding concentrations resulting from the samples analyzed by the on-site mobile laboratory.

4.2.3 Data Quality

On-site analysis was performed by the mobile laboratory operated by Columbia Technologies and off-site analysis was performed by the fixed laboratory operated by GCAL in accordance with the UFP-QAPP (AECOM, January 2016). AECOM performed intra-organizational QC checks of field and laboratory procedures used in collecting and analyzing the data. The QC checks verified the data collected were of appropriate quality for the intended data use. No QC excursions were encountered during the validation of this data set.

4.2.3.1 Mobile Laboratory

Data validation was performed on soil samples, field duplicates, and MS/MSD samples as part of the field activities conducted in May 2017. The validation was performed in accordance with the UFP QAPP (AECOM, January 2016).

Field and laboratory precision, field and laboratory accuracy, method compliance, and data set completeness were determined to be acceptable, based on the data submitted. No data were missing or rejected. All reported data are suitable for their intended use with the qualifications and clarifications noted in the DVR in **Appendix C** (**C2**).

While the data validation concluded that the data are suitable for their intended use, the laboratory reported LOD for PCE (0.002 mg/kg) and TCE (0.002 mg/kg) exceeded the most stringent soil screening criteria, the MCL-based protection of groundwater SSL (0.0023 mg/kg and 0.0018 mg/kg, respectively). However, based on the LOD achieved by the soil split samples analyzed at the off-site laboratory (GCAL) and the intended use of the soil data screening/delineation purposes, the detection limits do not appear to affect the data interpretations.

4.2.3.2 Off-Site Laboratory

Data validation was performed on soil samples, field duplicates samples, and MS/MSD samples as part of the field activities conducted in May 2017. The validation was performed in accordance with the UFP QAPP (AECOM, January 2016).

Field and laboratory precision, field and laboratory accuracy, method compliance, and data set completeness have been determined to be acceptable, based on the data submitted. No data were missing or rejected. All reported data are suitable for their intended use with the qualifications and clarifications noted in the DVR in **Appendix C** (**C3**).

Similar to the on-site laboratory results, the laboratory LOD for several analytes exceeded the MCL-based protection of groundwater SSL in result from split samples sent to the off-site fixed laboratory. However, based on the intended use of the data for screening and delineating potential residual source areas, the LODs do not appear to affect the data interpretations.

4.2.4 Summary

Ninety-three (93) soil samples were collected from 31 locations and analyzed by the on-site mobile laboratory for PCE and TCE. Split samples were collected from 10% of the total samples and analyzed for TCL VOCs by an off-site fixed laboratory. The purposes of the soil sampling were to refine the previous delineation of potential soil excavation areas and to characterize potential new sources identified from the MIP investigation portion of the field activities. A summary of the results of the soil sampling activities conducted as part of the data gap investigation include:

- Soils sampled within the extent of the ALARNG facility's boundaries did not exhibit TCE or PCE results above laboratory LODs.
- Two soil sample locations within the MAA property boundary (OMS-28-SB18 and –SB19) contained PCE and/or TCE above the MCL-based protection of groundwater SSL in samples from one or more depth intervals; however, neither the residential nor the industrial RSLs were exceeded.
- On the residential property (Parcel R022911360003106) adjacent to the MAA property, seven of the eight locations had detected concentrations from one or more sample depths, which exceeded the residential RSL, the industrial RSL, or the MCL-based protection of groundwater SSL for PCE and/or TCE.
- The industrial RSL was exceeded at one location, OMS-28-SB24 (1-foot bgs) on the residential property (Parcel R022911360003106) adjacent to the MAA property.
- The residential RSL was exceeded in four samples, OMS-28-SB24 (3-feet bgs), OMS-28-SB29 (1-foot bgs), OMS-28-SB30 (1-foot bgs), and OMS-28-SB31 (1-foot bgs), on the residential property (Parcel R022911360003106) adjacent to the MAA property.
- The origin for the source of PCE in soil is unknown since there is no record of ALARNG using PCE at the OMS #28 facility. However, the old ruins of a small shack were found within 15 feet of soil sample OMS-28-SB24, which had the highest concentrations of PCE in the surface and subsurface samples.

4.3 DISCRETE GROUNDWATER SAMPLING

As discussed in Section 2.6, the surficial aquifer at the site was divided into the upper surficial (water table), middle surficial, and lower surficial to define the shallow surficial aquifer vertically. In previous investigations, groundwater samples have only been collected from the upper/middle surficial aquifer zone. Since chlorinated VOCs tend to migrate vertically, a full vertical profile was warranted. Furthermore, the HPT data identified two sandy zone separated by a clay/silt zone that could act as a semi-confining layer.

4.3.1 Methods

Discrete groundwater sampling conducted using a DPT drill rig equipped with a discrete groundwater sampling tool. Locations were selected based on the results of the HPT/MIP investigation, results of the

soil investigation, monitoring well analytical data results, and discrete groundwater analytical results provided by the on-site mobile lab during the investigation. The groundwater sampling tool was pushed to the bottom of a 4-foot discrete depth interval and then the sampling tool's screen was opened. Tubing was passed through the hollow center of the drill rods, and collection of a groundwater grab sample was attempted using a peristaltic pump.

Collected groundwater samples were hand delivered to the on-site mobile laboratory, Columbia Technologies, which analyzed the samples for TCE and PCE via USEPA Method SW8260B. As a quality check, split samples were collected at a frequency of 10% of total groundwater samples and sent to an off-site fixed laboratory, GCAL, for analysis of TCL VOCs, except for vinyl chloride (VC), by USEPA Method SW8260B. Samples for VC were shipped to ALS Laboratory for analysis by USEPA Method 8260SIM. Field duplicate samples were collected at a 10% frequency and MS/MSD samples were collected at a 5% frequency.

In January/February 2018, a second mobilization occurred to extend the investigation to the west, south, and northeast (AECOM, January 2018). During this second discrete groundwater sampling mobilization, groundwater samples were shipped to GCAL for analysis for analysis of PCE, TCE, and cis-1,2-DCE by USEPA Method SW8260B, and samples for VC were shipped to Katahdin Analytical for analysis by USEPA Method 8260SIM .

4.3.2 Results

Two hundred and twenty-six (226) discrete groundwater samples were collected from 87 boring locations between May 2017 and January/February 2018. The locations of the discrete groundwater boring locations are presented in **Figure 4-1**. The mobile laboratory analytical results from May 2017 are presented as **Table 4-4** and are screened against USEPA MCLs (USEPA, March 2018). The summary results of VOC detections in the split samples analyzed by the fixed laboratory from May 2017 are presented in **Table 4-5** and are screened against the USEPA MCLs (USEPA, March 2018) and the Tapwater RSL values (USEPA, May 2018) for compounds with no listed MCL. The analytical results from January/February 2018 from the fixed laboratory are presented in **Table 4-6**. Discrete groundwater sampling logs are presented in **Appendix A** (**A6**). Laboratory reports are presented in **Appendix B** (**B4 - B17**) and the DVRs are provided in **Appendix C** (**C3** and **C4**). The following section will discuss the results of the discrete groundwater results in each of the three surficial aquifer zones

4.3.2.1 Upper Surficial Aquifer

In the Upper Surficial aquifer, two distinct plumes are present; one in the motor pool area of the ALARNG property east of the former wash pad and a second plume along the northwest portion of the MAA property and adjacent residential property (Parcel R022911360003106). **Figure 4-6** provides the approximate horizontal extent of TCE and PCE concentrations exceeding the MCLs (5 µg/L for both) in the Upper Surficial.

In the Upper Surficial aquifer, the groundwater within the ALARNG property had detected TCE concentrations exceeding the MCL (5 µg/L), with low and trace concentrations of cis-1,2-DCE and vinyl chloride. No PCE was detected within this plume. The highest concentration of TCE in the Upper Surficial aquifer within the ALARNG property was at GW32 (140 µg/L). The most norther portion of the

ALARNG TCE plume is in the area where surface soil samples had TCE in exceedance of the residential RSL and MCL-based protection of groundwater SSL (USEPA, May 2018).

In the Upper Surficial aquifer, the groundwater along the northwest portion of the MAA property and adjacent residential property (Parcel R022911360003106) had concentrations of PCE and TCE in exceedance of their respective MCLs (5 µg/L for both), with low and trace concentrations of cis-1,2-DCE and vinyl chloride. The highest concentration of PCE in MAA/residential groundwater was at GW22 (40,000 µg/L) while the highest concentration of TCE was at GW21 (510 µg/L). These plumes are within the area where soil sample results exceeded the residential and industrial RSLs and MCL-based protection of groundwater SSLs (USEPA, May 2018) for both TCE and PCE.

4.3.2.2 **Middle Surficial Aquifer**

The two TCE plumes from the Upper Surficial aquifer become one as TCE migrates vertically. Based on the CSM, there is no semi-confining unit separating the Upper and Middle Surficial aquifer zones; therefore, migration between the units is not impaired. The PCE plume from the Upper Surficial aquifer along the northwest portion of the MAA property and adjacent residential property (Parcel R022911360003106) has migrated vertically; however, the approximate horizontal extent in the Middle Surficial aquifer is similar the Upper Surficial aquifer. **Figure 4-7** provides the approximate horizontal extent of TCE and PCE concentrations exceeding the MCLs in the Middle Surficial aquifer.

The highest concentration of TCE in the Middle Surficial aquifer was at GW07 (310 µg/L), north of the area where soil samples had TCE in exceedance of the residential RSL and MCL-based protection of groundwater SSL (USEPA, May 2018). The highest concentration of PCE in the Middle Surficial aquifer was at GW40 (1,500 µg/L), west of the area where soil samples had PCE in exceedance of the residential and industrial RSL and MCL-based protection of groundwater SSL (USEPA, May 2018).

4.3.2.3 **Lower Surficial Aquifer**

In the Lower Surficial aquifer, TCE and PCE were found to exceed their MCLs (5 µg/L) in isolated locations and not in a continuous plume. **Figure 4-8** provides the approximate horizontal extent of TCE and PCE concentrations exceeding the MCLs in the Lower Surficial aquifer.

The isolated locations of TCE were located outside the footprint of the Middle Surficial aquifer TCE plume and ranged in concentration from 5.22 µg/L at GW89 located on the ALARNG property to 71.2 µg/L at GW08 located on the MAA property. PCE concentrations exceeding the MCL in the Lower Surficial Aquifer where identified at one location, GW22 (77 µg/L). This location was along the northwest portion of the MAA property and adjacent residential property (Parcel R022911360003106). This location is directly beneath the area where groundwater exceeded the MCL for PCE at greater concentrations. In addition, this location also had soil concentration exceeding residential and industrial RSLs and MCL-based protection of groundwater SSL (USEPA, May 2018).

4.3.3 Data Quality

On-site analysis was performed by the mobile laboratory operated by Columbia Technologies and off-site analysis was performed by the fixed laboratories operated by GCAL, ALS, and Katahdin in accordance with the UFP-QAPP (AECOM, January 2016, December 2017). AECOM performed intra-organizational QC checks of field and laboratory procedures used in collecting and analyzing the data. The QC checks

verified the data collected were of appropriate quality for the intended data use. No QC excursions were encountered during the validation of this data set.

4.3.3.1 **Mobile Laboratory**

Data validation was performed on groundwater samples, field duplicates, and MS/MSD samples as part of the field activities conducted in May 2017. The validation was performed in accordance with the UFP QAPP (AECOM, January 2016).

Field and laboratory precision, field and laboratory accuracy, method compliance, and data set completeness were determined to be acceptable, based on the data submitted. No data were missing or rejected. All reported data are suitable for their intended use with the qualifications and clarifications noted in the DVR in **Appendix C** (**C2**).

The overall data assessment determined that the field and laboratory precision, field and laboratory accuracy, method compliance, and data set completeness were acceptable based on the data submitted. No data were missing or rejected. All reported data are suitable for their intended use with the qualifications and clarifications noted in the DVRs.

4.3.3.2 **Off-Site Laboratory**

Data validation was performed on groundwater samples, field duplicates samples, and MS/MSD samples as part of the field activities conducted in May 2017 and January/February 2018. The validation was performed in accordance with the UFP QAPP (AECOM, January 2016, December 2017).

Field and laboratory precision, field and laboratory accuracy, method compliance, and data set completeness have been determined to be acceptable, based on the data submitted. No data were missing or rejected. All reported data are suitable for their intended use with the qualifications and clarifications noted in the DVR in **Appendix C** (**C3, and C4**).

The overall data assessment determined that the field and laboratory precision, field and laboratory accuracy, method compliance, and data set completeness were acceptable based on the data submitted. No data were missing or rejected. All reported data are suitable for their intended use with the qualifications and clarifications noted in the DVRs.

4.3.4 Summary

Discrete groundwater samples were collected from the Upper, Middle, and Lower Surficial aquifer to profile the TCE and PCE vertically in the groundwater for the purposes of refining the CSM and collecting data to support implementation of the remedy. Two hundred and twenty-six (226) discrete groundwater samples were collected from 87 boring locations between May 2017 and February 2018. A summary of the results of the discrete groundwater sampling activities conducted as part of the data gap investigation include:

- An additional soil source of groundwater contamination was identified along the northwest boundary of the MAA property and the adjacent residential property (Parcel R022911360003106).
- TCE in the groundwater consists of two distinct plumes in the Upper Surficial aquifer that merge into one plume as the TCE migrates vertically to the Middle Surficial aquifer.

- Concentrations of TCE exceeding screening criteria were detected in the groundwater of the Lower Surficial aquifer. It is suspected that the semi-confining layer identified through HPT and the ESS prevents the TCE groundwater plume in the Middle Surficial aquifer from migrating into the Lower Surficial aquifer and that the isolated locations of breakthrough may be from connectivity of sand lenses within the fine-grained material comprising the semi-confining layer.
- There is uncertainty whether the TCE in the groundwater from the newly identified source along the northwest boundary of the MAA property and the adjacent residential property (Parcel R022911360003106) is from in-place degradation of the PCE also identified there, or is a primary constituent as with the plume identified within the ALARNG property.
- PCE in groundwater was only identified in the northern portion of the MAA property and the adjacent residential property (Parcel R022911360003106).

4.4 IDW MANAGEMENT

During the May 2017 discrete groundwater sampling event, seven drums of purge and decontamination water were generated in combination with the purge and decontamination water from the groundwater well sampling (Section 3.0). The IDW was stored in 55-gallon drums. The drums were transported on August 8, 2017 by Horizon Environmental Services, LLC. Analytical data generated during the sampling events were submitted to Horizon Environmental Services, LLC and determined that the aqueous IDW was non-hazardous. Horizon Environmental Services, LLC disposed of the nine aqueous drums of IDW as non-hazardous waste. The manifest is provided in **Appendix D** (**D1**). In addition to the aqueous IDW drums, one soil IDW drum was generated from soil sampling. That drum was transported on August 8, 2017 with the aqueous drums by Horizon Environmental Services, LLC. Analytical data generated during the soil sampling event were submitted to Horizon Environmental Services, LLC and determined that the soil IDW was non-hazardous. Horizon Environmental Services, LLC disposed of the one soil drum of IDW as non-hazardous waste. The manifest is provided in **Appendix D** (**D1**).

During the January/February 2018 sampling event, two drums of purge and decontamination water and one drum of soil were generated as part of the expanded discrete groundwater sampling event. The IDW was stored in 55-gallon drums. The drums were transported on September 6, 2018 by A&D Environmental. Analytical data generated during the sampling events were submitted to A&D Environmental and determined that the IDW was non-hazardous. A&D Environmental disposed of the two aqueous drums of IDW and one soil drum of IDW as non-hazardous waste. The manifest is provided in **Appendix D** (**D2**).

5.0 CONCLUSIONS

This section presents a summary of conclusions from the two groundwater sampling events conducted in January 2016 and May 2017, and a summary of conclusions from the Data Gap Investigation performed from May 2017 through February 2018.

5.1 JANUARY 2016 AND MAY 2017 GROUNDWATER WELL SAMPLING

During the January 2016 and May 2017 groundwater sampling of the wells, 11 wells were sampled for TCL VOCs. During both events, PCE was found to exceeded its MCL in only one well, OMS-28-5. During the January 2016 groundwater sampling event, three wells (MW-8, OMS-28-3, and OMS 28 5) had exceedances of TCE above its MCL. However, during the May 2017 groundwater sampling event, concentrations of TCE at well MW-8 fell below the MCL. This well is located within the area where soils were found to have exceeded the MCL-based protection of groundwater SSL.

Concentrations of TCE and PCE degradation product, cis-1,2-DCE, were detected in two wells during both sampling events, OMS-28-3 and OMS-28-5. Both wells are located within the TCE plume and well OMS-28-5 is located within the PCE plume. Concentrations of cis-1,2-DCE exceeded the MCL at well OMS-28-5 during the May 2017 sampling event. Concentrations of degradation product vinyl chloride were not detected above the LOD in either of the sampling events.

5.2 MIP / HPT

The MIP locations were planned based on the initial CSM presented in the RI (SAIC, May 2013) and historical knowledge of features that may have been potential sources of groundwater contamination, such as the former pollution control system. MIP borings were drilled within the area where the PCE plume was originally estimated to be located. No significant responses were identified within the MIP logs that would indicate a soil source for groundwater.

The HPT/EC investigation results aided in the development of the ESS, discussed in Section 2.6, and were used to help guide the selection of sample depths for the discrete groundwater sampling event to target sand zones. This data helped to determine the Upper, Middle and Lower Surficial Aquifer zones.

5.3 SOIL

Ninety-three (93) soil samples were collected and analyzed for PCE and TCE from 31 boring locations. The purpose of the soil sampling was to refine the previous delineation of potential soil excavation areas and to characterize possible new sources potentially identified from the MIP investigation portion of the field activities.

Soil samples were collected around the perimeter of an area on the ALARNG property identified in the RI (SAIC, May 2013) as the exceedance of the SSL (**Figure 1-4**). The surface and subsurface soil samples collected as part of the Data Gap Investigation within the ALARNG property did not exceed LODs for TCE and PCE. Several soil samples collected as part of historical sampling events did exceed the MCL-based protection of groundwater SSL for TCE; however, the depths of these samples exceeded the current depth to groundwater.

Samples collected along the former pollution control system did not exceed LODs for TCE and PCE.

Soil samples were also collected around location B-13 located at well MW-9. This soil boring and samples were collected at the time of the installation of well MW-9 and the surface soil sample at this location exceeded the MCL-based protection of groundwater SSL for TCE (USEPA, May 2018). The surface and subsurface soil samples collected at this location as part of the Data Gap Investigation did not exceed LODs for TCE and PCE. Further, the groundwater concentration for TCE at this location does not exceed the MCL for TCE or the laboratory LOD.

A new source area was identified along the northwest portion of the MAA property and adjacent residential property (Parcel R022911360003106). The origin for the source of PCE is unknown since there is no record of ALARNG using PCE at the OMS #28 facility. However, the old ruins of a small shack were found within 15 feet of soil sample SB24, which had the highest concentration of PCE in the surface and subsurface samples. PCE concentrations in surface soils from this area exceeded either the residential or industrial RSL or the MCL-based protection of groundwater SSL (USEPA, May 2018). Subsurface soil exceeded either the residential RSL or the MCL-based protection of groundwater SSL (USEPA, May 2018).

5.4 GROUNDWATER

Discrete groundwater samples were collected from the Upper, Middle, and Lower Surficial aquifer to profile the TCE and PCE vertically in the groundwater for the purposes of refining the CSM and implementation of the remedy. Two hundred and twenty-six (226) discrete groundwater samples were collected from 87 boring locations between May 2017 and January/February 2018. Figure 5-1 shows the approximate extent of the PCE and TCE impacts in the Upper/Middle Surficial aquifer and the Lower Surficial aquifer based on data collected during this Supplemental Data Gap Investigation.

TCE in the groundwater consists of two distinct plumes in the Upper Surficial aquifer merging into one plume the Middle Surficial aquifer as the TCE migrates vertically. One distinct groundwater plume of TCE in the Upper Surficial aquifer was contained within ALARNG property in the motor pool area near the soil samples, which exceeded the MCL-based protection of groundwater SSL. The second distinct plume of TCE was along the northwest boundary of the MAA property and the adjacent residential property (Parcel R022911360003106). TCE was found in the Lower Surficial aquifer in isolated locations, outside of the footprint of the TCE plume/plumes in the Upper and Lower Surficial aquifers. It is suspected that the TCE migrated downward via sand lenses within the semi-confining unit separating the Middle Surficial from the Lower Surficial aquifer.

PCE in the groundwater was not found on the ALARNG property. PCE only exceeded its MCL along the northwest boundary of the MAA property and the adjacent residential property (Parcel R022911360003106) where the soil contained PCE concentration exceeding the industrial and residential RSLs and the MCL-based protection of groundwater SSL. Concentrations of PCE in exceedance of the MCLs in the Upper and Middle Surficial aquifer zones have a similar areal extent. Groundwater concentrations exceeding the MCL for PCE in the Lower Surficial aquifer were only detected at one location along the northwest boundary of the MAA property and the adjacent residential property (Parcel R022911360003106) where the soil exceeded the industrial and residential RSL and the MCL-based protection of groundwater SSL.

5.5 CONCLUSIONS

The objectives of the Supplemental Data Gap Investigation, performed from May 2017 through February 2018, have been achieved. The soil sources areas and groundwater contaminate plumes have been sufficiently delineated to proceed to the design phase of the remedial alternative.

Table 3-3
Analytical Results in Groundwater - 2016-2017
Alabama Army National Guard, OMS #28
Mobile, Alabama

Notes:

Screening criteria is the USEPA Maximum Contaminant Limit (MCL). Since no MCL is provided for trans-1,2-dichloroethene, the USEPA Tapwater Risk Screening Level (RSL) based on a risk of E-06 for carcinogens and HQ of 0.1 for non-carcinogens (USEPA, May 2018) is used.

MCL* - The individual trihalomethanes (bromodichloromethane; bromoform; dibromochloromethane, and chloroform) all have the MCL of 80 µg/L listed. However, 80 µg/L is the MCL for Total Trihalomethanes.
Bold result indicates the analyte was detected.
Shading indicates the screening value is exceeded.

Data Qualifiers:
< = the numeric value resented is the sample specific detection limit.
U = The analytie was analyzed for, but was not detected above the level of the reported sample quantitation limit.

J = The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

UJ = The analyte was analzed for, but was not detected. The repoerted quantitation limit is approximate and may be inaccurate or imprecise.

Definitions:
µg/L = micrograms per Liter (parts per billion (ppb))
USEPA - United States Environmental Protection Agency

				Destroyed			

Definitions:
µg/L = micrograms per Liter (parts per billion (ppb))
ft btoc = feet below top of casing
NA = Not Analyzed

Notes:
All concentrations in µg/L
Bold result indicates the analyte was detected.
Shading indicates the screening value is exceeded.

Data Qualifiers:
U = The analytie was analyzed for, but was not detected above the level of the reported sample quantitation limit.
J = The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

	5/16/2017	5		**0.0887**	< 0.002 (U)

Notes:

Soil samples were analyzed utilizing a DOD certified mobile laboratory for TCE and PCE by Method 8260B.

Results are reported in mg/kg.

Soil Screening Criteria is based on the USEPA Regional Screening Level (RSL) Table for Residential, Industrial, and MCL-based Protection of Groundwater Soil Screening Levels (SSLs), based on a risk of 1E-06 for carcinogens and HQ 0.1 for noncarcinogens (USEPA, May 2018).

Bold results indicates the analyte was detected.

Shading indicates the respective screening value is exceeded.

Data Qualifiers:

< - the numeric value presented is the sample specific detection limit

U - The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit.

J - The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

UJ -The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

Definitions:

mg/kg - milligrams per kilogram

DOD - Department of Defense

MCL - Maximum Contaminant Level

PCE - Tetrachloroethene

SSL - Soil Screening Level

TCE - Trichloroethene

USEPA - United States Environmental Protection Agency

Notes:

Soil samples were analyzed in the field by GCAL Laboratory for a target compound list (TCL) of Volatile Organic Compounds via Method SW8260B. Only detected analytes are shown.

Results are reported in mg/kg.

Soil Screening Criteria is based on the USEPA Regional Screening Level (RSL) Table for Residential, Industrial, and MCL-based Protection of Groundwater Soil Screening Levels (SSLs), based on a risk of 1E-06 for carcinogens and HQ 0.1 for noncarcinogens (USEPA, May 2018).

Bold results indicates the analyte was detected.

Shading indicates the respective screening value is exceeded.

Data Qualifiers:

< - the numeric value presented is the sample specific detection limit

U - The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit.

J - The result is an estimated quality. The associated numerical value is the approximate concentration of the analyte in the sample.

Definitions:

mg/kg - miligrams per kilogram

MCL - Maximum Contaminant Level

NS - No Standard

PCE - Tetrachloroethene

SSL - Soil Screening Level

TCE - Trichloroethene

USEPA - Environmental Protection Agency

* - indicates, the analyte is a noncarcinogen and the risk-based SSL is used as no MCL-Based Protection of Groundwater SSL is available.

Table 4-4
Discrete Groundwater Results, May 2017 - Mobile Laboratory
Alabama Army National Guard, OMS #28
Mobile, Alabama

			Chemicals of Concern	PCE	TCE
Groundwater Screening Criteria	**Maximum Contaminant Levels**			**5**	**5**
Boring Location	**Sample Depth (ft bgs)**	**Sample Zone**	**Sample Date**		
OMS-28-GW72	29-33	Lower Surficial	5/19/2017	< 1 (U)	< 1 (U)

Notes:
Groundwater samples were analyzed in the field by Columbia Technology's mobile laboratory for TCE and PCE via Method SW8260B.
The Screening Criteria is based on the USEPA Maximum Contamination Limit (MCL).
Results are reported in (µg/L).
Bold results indicates the analyte was detected.
Shading indicates the screening value was exceeded.
Sample Depth is reported as feet below ground surface (ft bgs).

Data Qualifiers:
< - the numeric value presented is the sample specific detection limit.
U - The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit.
J - The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

Definitions:
µg/L - microgram per liter
TCE - Trichloroethene
PCE - Tetrachloroethene
USEPA - United States Environmental Protection Agency

Table 4-5
Groundwater Split Samples Summary Results - May 2017
Alabama Army National Guard, OSM # 28
Mobile, Alabama

Notes:

Groundwater samples were analyzed by GCAL for TCL VOCs by Method 8260B except vinyl chloride.
Vinyl chloride anlayzed by ALS Environmental by Method 8260SIM.

Results are reported in µg/L.

The screening criteria is based on the USEPA Maximum Contamination Limit (MCL). If MCLs are not avaiable, the Tap Water regional screening level (RSL) was used.

Bold indicates analyte concentration detected above the limit of detection (LOD).

Shading indicates the analyte was detected in exceedance of its respective screening value.

Data Qualifiers:

J - Estimated value detected below the limit of detection.

U - Indicates not detected at the limit of detection indicated.

Definitions:

µg/L - micrograms per liter

ft bgs - feet below ground surface

LOD - Limit of Detection

RSL - regional screening level

MCL - maximum contamination limit

Notes:
1. Concentrations in micrograms per liter (µg/L).
2. Samples collected in January 2016 and May 2017.
3. Only chemicals of concern (COCs) and chlorinated degradation products shown.
4. Red values indication concentration exceeded the screening criteria.
5. PCE - Tetrachloroethene
6. TCE - Trichloroethene
7. DCE - Dichloroethene
8. VC - Vinyl Chloride
9. MCL - Maximum Contaminant Limit
10. J - The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
11. Please see table 3-4 for historical groundwater results.

Screening Criteria

	PCE	TCE
Residential RSL	8.1	0.41
Industrial RSL	39	1.9
MCL-Based Protection of Groundwater SSL	0.0023	0.0018

Site Location

Legend

- Hand Auger Samples Collected in
- Soil Boring Samples Collected in 2006/2007
- Soil Sample Locations Collected in 2017
- TCE and/or PCE Exceed MCL- Based Protection of Groundwater SSL
- TCE and/or PCE Exceed Residential RSL
- TCE and/or PCE Exceed Industrial RSL
- Approximate soil area exceeding MCL - Based on Protection of Groundwater SSL
- Approximate soil area exceeding Residential and/or Industrial RSL
- Railroad
- Approximate Ditch Orientation
- Approximate Ditch Orientation Flow Direction
- Fenceline
- Parcel Boundary

Notes:
1 - Soil Samples collected between May 8-16, 2017.
2 - Analytical results from mobile lab used unless split with fixed lab. Fixed lab samples denoted with "*".
3 - Soil concentrations in milligrams per kilogram.
4 - All samples collected from bottom of 0-1 ft interval and analyzed by Method 8260.
5 - Residential and Industrial RSLs are based on risk of 1E-06 forcarcinogens.
6 - No highlighting of symbol indicates TCE and PCE did not exceed any RSLs or SSL.
7 - If TCE/PCE not listed, they did not exceed any of the screening criteria. Analytical results for samples collected in 2017 can be found on Tables 4-2 and 4-3.
8 - Analytical results for samples collected in 2006/2007 can be found in the TCE Comprehensive Investigation Report (Aerostar, April 2007).

J - The result of an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
U - The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit.

Well Maintenance Form

Date: 1-19-2016

Recorded By: Randy Morgan

Well ID: OMS-28-7 **Well Identification:** none

Well Pad: good 3X3 in gravel lot

Vault Type: ☒ Flush Mount ☐ Stick-Up Description:

Brand: Pemco Size: ☒ 8-Inch ☐ 12-Inch ☐ Other: Bolts: ☒ Two ☐ Three ☐ Four ☐ NA

Bolt Size: ☒ 9/16 ☐ 5/8 ☐ 1/2 ☐ 3/4 ☐ Other: Bolt Tab Condition: good

Gasket: ☒ Good ☐ Poor/Usable ☐ Missing Condition of Vault Interior: good

Well Size: ☒ 2-Inch ☐ 4-Inch ☐ Other: Well Casing: ☐ PVC ☐ Stainless Steel ☐ Other

Condition of the Top of Casing: good Measuring Point: ☐ Good ☐ Needs Recut ☒ None

Well Plug Vented?: ☒ Yes ☐ No Well Plug Type: ☒ Compression ☐ Slip Cap ☐ Other:

Well plug Condition: ☒ Good ☐ Poor/Usable ☐ Needs Replacement Lock Present: ☐ Yes ☒ No Condition: ☐ Good ☐ Poor

Does this well require a low profile, schedule 80 or other special plug? Describe: yes due to female threaded PVC TOC

OTHER Environmental Concerns?

Comments: new lock on well

Well ID: MW-5 **Well Identification:** none

Well Pad: no - In cement parking ~~lot~~ lot

Vault Type: ☒ Flush Mount ☐ Stick-Up Description:

Brand: Brainard - Kilman Size: ☒ 8-Inch ☐ 12-Inch ☐ Other: Bolts: ☐ Two ☒ Three ☐ Four ☐ NA

Bolt Size: ☒ 9/16 ☐ 5/8 ☐ 1/2 ☐ 3/4 ☐ Other: (No bolts) Bolt Tab Condition: good

Gasket: ☒ Good ☐ Poor/Usable ☐ Missing Condition of Vault Interior:

Well Size: ☒ 2-Inch ☐ 4-Inch ☐ Other: Well Casing: ☒ PVC ☐ Stainless Steel ☐ Other

Condition of the Top of Casing: good (2" Coupling) Measuring Point: ☐ Good ☐ Needs Recut ☒ None

Well Plug Vented?: ☐ Yes ☒ No Well Plug Type: ☒ Compression ☐ Slip Cap ☐ Other:

Well plug Condition: ☐ Good ☐ Poor/Usable ☒ Needs Replacement Lock Present: ☐ Yes ☒ No Condition: ☐ Good ☐ Poor

Does this well require a low profile, schedule 80 or other special plug? Describe: yes due to 2" Coupling at TOC

OTHER Environmental Concerns?

Comments: New well cap and lock

Well ID: MW-6 **Well Identification:** none

Well Pad: (no) In cement parking lot

Vault Type: ☒ Flush Mount ☐ Stick-Up Description:

Brand: Morrison Size: ☒ 8-Inch ☐ 12-Inch ☐ Other: Bolts: ☒ Two ☐ Three ☐ Four ☐ NA

Bolt Size: ☐ 9/16 ☐ 5/8 ☒ 1/2 ☐ 3/4 ☐ Other: Bolt Tab Condition: good

Gasket: ☒ Good ☐ Poor/Usable ☐ Missing Condition of Vault Interior: good

Well Size: ☒ 2-Inch ☐ 4-Inch ☐ Other: Well Casing: ☒ PVC ☐ Stainless Steel ☐ Other

Condition of the Top of Casing: good Measuring Point: ☐ Good ☐ Needs Recut ☒ None

Well Plug Vented?: ☒ Yes ☐ No Well Plug Type: ☒ Compression ☐ Slip Cap ☐ Other:

Well plug Condition: ☒ Good ☐ Poor/Usable ☐ Needs Replacement Lock Present: ☐ Yes ☒ No Condition: ☐ Good ☐ Poor

Does this well require a low profile, schedule 80 or other special plug? Describe: No

OTHER Environmental Concerns?

Comments: new lock installed on well

Appendix A3
Groundwater Monitoring Well Sampling Logs - January 2016

AECOM

FIELD DATA LOG FOR GROUNDWATER SAMPLING

Date (mo/day/yr)	Jan 20, 2016
Field Personnel	Randy Morgan
Site Name	ALARNG OMS #28
AECOM Job #	60439687
Sample ID*	MW-5
____ Upgradient ____ Downgradient ____ Sidegradient ____ Source	
Weather Conditions	partly cloudy
Air Temperature	60 ° F
Total Well Depth (TWD) =	12.65 1/100 ft
Depth to Ground Water (DGW) =	4.03 @ 1313 1/100 ft
Length of Water Column (LWC) = TWD - DGW =	8.62 1/100 ft
1 Casing Volume (OCV)* = LWC x 0.163 =	1.40 gal
3 Casing Volumes =	4.21 gal = Standard Evacuation Volume
Method of Sample Evacuation	Peristaltic Pump
Method of Sample Collection	Peristaltic Pump / Reverse flow
Total Volume of Water Removed	3.0 gal

Casing Diameter	2 inches
Casing Material	
Measuring Point Elevation	1/100 ft
Height of Riser (above land surface)	1/100 ft
Land Surface Elevation	1/100 ft
Screened Interval	3.3 - 13.3 1/100 ft
Dedicated Pump or Bailer	YES ____ NO X Type ____
Steel Guard Pipe Around Casing	YES X NO ____
Locking Cap	YES X NO ____
Protective Post/Abutment	YES ____ NO X
Well Integrity Satisfactory	YES X NO ____
Yield	LOW ____ MODERATE ____ HIGH X
Comments/Observations	
Sample Time:	1400
Sample Analytes: VOC'S	tubing inlet @ 4.0' off bottom
	Fe= 0.14

* - One casing volume (gallons) for a 0.5 inch well is 0.0102XLWC; for a 2 inch well is 0.163 X LWC, for a 4 inch well is 0.652 X LWC and for a 6 inch well is 1.468 X LWC.

Volume (in gallons) = $\pi r^2 h$ (7.48), where r is the radius (ft) and h is the height (ft).

Yield: LOW ____ MODERATE ____ HIGH X
Comments/Observations
Sample Time: 1623
Sample Analytes: VOC'S MS/MSD q/so
Fe = 0.0 mg/L

* - One casing volume (gallons) for a 0.5 inch well is 0.0102XLWC; for a 2 inch well is 0.163 X LWC; for a 4 inch well is 0.652 X LWC and for a 6 inch well is 1.468 X LWC

Volume (in gallons) = $\pi r^2 h$ (7.48), where r is the radius (ft) and h is the height (ft).

GROUNDWATER SAMPLING LOG

Date (mo/day/yr): May 1, 2017
Field Personnel: Randy Morgan
Site Name: ARNG OMS 28 Phase 2
AECOM Job #: 60439687
Well ID #: OMS-28-1
Upgradient ___ X ___ Downgradient
Weather Conditions: Clear / sunny
Air Temperature: ___ ° F

Total Depth (TWD) Below Top of Casing = 79.84 1/100 ft
Depth to Groundwater (DGW) Below Top of Casing = 22.44 1/100 ft
Length of Water Column (LWC) = TWD - DGW = 57.40 1/100 ft
1 Casing Volume (OCV) = LWC x 0.163 = 9.35 gal
3 Casing Volumes = 28.06 gal
Method of Well Evacuation: Peristaltic Pump
Method of Sample Collection: Peristaltic Pump / reverse flow
Total Volume of Water Removed: 4.0 gal

Casing Diameter: 2 inches
Casing Material: PVC
Measuring Point Elevation: TOC 1/100 ft
Height of Riser (above land surface): ___ 1/100 ft
Land Surface Elevation: ___ 1/100 ft
Screened Interval (below land surface): 70.0 - 80.0 1/100 ft

Container	Analysis (Method)	# Bottles	Preservative	Dup - MS/MSD
40 ml glass	VOC's (8260B)	3	HCL

Total Depth to Bottom of Borehole (feet): 36' ft

Depth of Sample Collection: 0-1

Sample ID: oms-28-SB04-1

Method of Sample Collection
- [x] Discrete primary
- [x] Encore/TerraCore split
- [ ] Composite

Construction Method
- [x] DPT
- [ ] Hand Auger
- [ ] Other (Specify):

Analysis Performed:
- [x] VOCs (8260)
- [ ] SVOCs (8270)
- [ ] Metals (6020)
- [ ] Other (Specify)

Laboratory
- [x] Fixed Lab: GCAL
- [x] Mobile Lab: Columbia Tech

Quality Control Samples:
- [x] Duplicate
- [ ] MS/MSD
- [ ] Equipment Blank
- [x] Split

Notes/Comments/Additional Info:

primary and dup to Columbia Tech (TCE+PCE 8260B)
Split (-s) to GCAL (VOCs 8260B)
36 ft drilled for lithology

Field Personnel: Randy Morgan, Dunn Henry, Vasi Kourlos

Borehole ID: SB19

Total Depth to Bottom of Borehole (feet): 5 ft

Depth of Sample Collection: 5ft

Sample ID:

Method of Sample Collection
- (●) Discrete
- ( ) Encore/TerraCore
- ( ) Composite

Construction Method
- (●) DPT
- ( ) Hand Auger
- ( ) Other (Specify):

Analysis Performed:
- (●) VOCs (8260) PCE/TCE
- ( ) SVOCs (8270)
- ( ) Metals (6020)
- ( ) Other (Specify)

Laboratory
- ( ) Fixed Lab:
- (●) Mobile Lab: Columbia Technologies

Quality Control Samples:
- ( ) Duplicate
- ( ) MS/MSD
- ( ) Equipment Blank
- ( ) Split

Notes/Comments/Additional Info:

OMS-28-SB19-5-a duplicate to Columbia Technologies

Discrete Groundwater Sampling Logs

GROUNDWATER SAMPLING LOG

Date (mo/day/yr) May 2, 2017
Field Personnel
Site Name ARNG OMS 28 Phase 2 - GW Grab Sampling
AECOM Job # 60439687
Well ID # OMS-28-GW01
____ Upgradient ____ Downgradient
Weather Conditions Clear / Sunny
Air Temperature ° F
Total Depth (TWD) Below Top of Casing = 1/100 ft
Depth to Groundwater (DGW) Below Top of Casing = 1/100 ft
Length of Water Column (LWC) = TWD - DGW = 1/100 ft
1 Casing Volume (OCV) = LWC x ~~0.163~~ = gal
3 Casing Volumes = gal
Method of Well Evacuation peristaltic pump
Method of Sample Collection
Total Volume of Water Removed gal

Casing Diameter N/A inches
Casing Material N/A
Measuring Point Elevation N/A 1/100 ft
Height of Riser (above land surface) N/A 1/100 ft
Land Surface Elevation N/A 1/100 ft
Screened Interval (below land surface) 1/100 ft

Container	Analysis (Method)	# Bottles	Preservative	Dup - MS/MSD
40 ml glass	VOC's ACE + TCE	2	HCL	

6-10 ~~5~~-19 28-32 **FIELD ANALYSES**

VOLUME PURGED (gallons)							
TIME (Military) Sample time	0850	~~1~~ 0955	1020				
Depth to Groundwater Below Top of Casing (ft)		Insufficient					
Drawdown (ft)		Volume					
pH (S.U.)	5.69	to	5.60				
Salinity (ppt)	0.21	get	0.05				
Sp. Cond. (mS/cm)	0.431	parameters	0.109				
Turbidity (NTUs)	546.6		>1100 Grey				
Dissolved Oxygen (mg/L)	1.94		0.71				
Water Temperature (°C)	25.05		27.88				
ORP (mV)	73.8		-57.5

GROUNDWATER SAMPLING LOG

Date (mo/day/yr) May 16 2017
Field Personnel Randy McLean
Site Name ARNG OMS 28 Phase 2 - GW Grab Sampling
AECOM Job # 60439687
Well ID # OMS-28-GW59
____ Upgradient ____ Downgradient
Weather Conditions Clear / Sunny
Air Temperature ____ ° F
Total Depth (TWD) Below Top of Casing = ____ 1/100 ft
Depth to Groundwater (DGW) Below Top of Casing = ____ 1/100 ft
Length of Water Column (LWC) = TWD - DGW = ____ 1/100 ft
1 Casing Volume (OCV) = LWC x 0.163 = ____ gal
3 Casing Volumes = ____ gal
Method of Well Evacuation Peristaltic Pump
Method of Sample Collection Peristaltic Pump
Total Volume of Water Removed ____ gal

Casing Diameter N/A inches
Casing Material N/A
Measuring Point Elevation N/A 1/100 ft
Height of Riser (above land surface) N/A 1/100 ft
Land Surface Elevation N/A 1/100 ft
Screened Interval (below land surface) ____ 1/100 ft

Container	Analysis (Method)	# Bottles	Preservative	Dup - MS/MSD
40ml glass	PCE / TCE	2	None	

FIELD ANALYSES

	610	14-18	26-30					
VOLUME PURGED (gallons)								
TIME (Military)	1135	1200	1245

Appendix B1
GCAL Report 216012310 dated January 28, 2016

NELAP CERTIFICATE NUMBER: 01955
DOD ELAP CERTIFICATE NUMBER: L14-243

ANALYTICAL RESULTS

PERFORMED BY

GCAL, LLC
7979 Innovation Park Dr.
Baton Rouge, LA 70820

Report Date 01/28/2016

GCAL Report 216012310

Project Greenville OMS 60439678

Deliver To	***Additional Recipients***
Steve Holt AECOM 10 Patewood Drive, Bldg. VI Suite 500 Greenville, SC 29615 864-234-2260	NONE

Laboratory Endorsement

Sample analysis was performed in accordance with approved methodologies provided by the Environmental Protection Agency or other recognized agencies. The samples and their corresponding extracts will be maintained for a period of 30 days unless otherwise arranged. Following this retention period the samples will be disposed in accordance with GCAL's Standard Operating Procedures.

Common Abbreviations that may be Utilized in this Report

ND	Indicates the result was Not Detected at the specified reporting limit
DO	Indicates the result was Diluted Out
MI	Indicates the result was subject to Matrix Interference
TNTC	Indicates the result was Too Numerous To Count
SUBC	Indicates the analysis was Sub-Contracted
FLD	Indicates the analysis was performed in the Field
DL	Detection Limit
DL	Diluted analysis – when appended to Client Sample ID
LOD	Limit of Detection
LOQ	Limit of Quantitation
RE	Re-analysis
00:01	Reported as a time equivalent to 12:00 AM

Reporting Flags that may be Utilized in this Report

J or I	Indicates the result is between the MDL and LOQ
J	DOD flag on analyte in the parent sample for MS/MSD outside acceptance criteria
U	Indicates the compound was analyzed for but not detected
B or V	Indicates the analyte was detected in the associated Method Blank
Q	Indicates a non-compliant QC Result (See Q Flag Application Report)
*****	Indicates a non-compliant or not applicable QC recovery or RPD – see narrative
E	The result is estimated because it exceeded the instrument calibration range
E	Metals - % diference for the serial dilution is > 10%

Sample receipt at GCAL is documented through the attached chain of custody. In accordance with NELAC, this report shall be reproduced only in full and with the written permission of GCAL. The results contained within this report relate only to the samples reported. The documented results are presented within this report.

This report pertains only to the samples listed in the Report Sample Summary and should be retained as a permanent record thereof. The results contained within this report are intended for the use of the client. Any unauthorized use of the information contained in this report is prohibited.

I certify that this data package is in compliance with The NELAC Institute (TNI) Standard 2009 and terms and conditions of the contract and Statement of Work both technically and for completeness, for other than the conditions in the case narrative. Release of the data contained in this hardcopy data package and in the computer readable data submitted has been authorized by the Quality Assurance Manager or his/her designee, as verified by the following signature.

Estimated uncertainty of measurement is available upon request. This report is in compliance with the DOD QSM as specified in the contract if applicable.

Case Narrative

Client: AECOM **Report:** 216012310

Gulf Coast Analytical Laboratories received and analyzed the sample(s) listed on the Report Sample Summary page of this report. Receipt of the sample(s) is documented by the attached chain of custody. This applies only to the sample(s) listed in this report. No sample integrity or quality control exceptions were identified unless noted below.

No anomalies were found for the analyzed sample(s).

Q Flag Summary

Dil Factor: 1.00000
Integrator: HP RTE Compound Sublist: 8260b-CVE.sub
Target Version: 3.50
Processing Host: org.gcal.com

Concentration Formula: Amt * DF * Uf/Vo * CpndVariable

Name	Value	Description
DF	1.00000	Dilution Factor
Uf	5.00000	ng unit correction factor
Vo	5.00000	Sample Volume purged (mL)
DF	1.00000	

Cpnd Variable Local Compound Variable

Als bottle: 1 QC Sample: LCS
Dil Factor: 1.00000
Integrator: HP RTE Compound Sublist: 8260b-CVE.sub
Target Version: 3.50
Processing Host: org.gcal.com

Concentration Formula: Amt * DF * Uf/Vo * CpndVariable

Name	Value	Description
DF	1.00000	Dilution Factor
Uf	5.00000	ng unit correction factor
Vo	5.00000	Sample Volume purged (mL)
DF	1.00000	

Cpnd Variable Local Compound Variable

Deliver To	***Additional Recipients***
Steve Holt AECOM 10 Patewood Drive, Bldg. VI Suite 500 Greenville, SC 29615 864-234-2260	NONE

Laboratory Endorsement

Sample analysis was performed in accordance with approved methodologies provided by the Environmental Protection Agency or other recognized agencies. The samples and their corresponding extracts will be maintained for a period of 30 days unless otherwise arranged. Following this retention period the samples will be disposed in accordance with GCAL's Standard Operating Procedures.

Common Abbreviations that may be Utilized in this Report

ND	Indicates the result was Not Detected at the specified reporting limit
DO	Indicates the result was Diluted Out
MI	Indicates the result was subject to Matrix Interference
TNTC	Indicates the result was Too Numerous To Count
SUBC	Indicates the analysis was Sub-Contracted
FLD	Indicates the analysis was performed in the Field
DL	Detection Limit
DL	Diluted analysis – when appended to Client Sample ID
LOD	Limit of Detection
LOQ	Limit of Quantitation
RE	Re-analysis
00:01	Reported as a time equivalent to 12:00 AM

Reporting Flags that may be Utilized in this Report

J or I	Indicates the result is between the MDL and LOQ
J	DOD flag on analyte in the parent sample for MS/MSD outside acceptance criteria
U	Indicates the compound was analyzed for but not detected
B or V	Indicates the analyte was detected in the associated Method Blank
Q	Indicates a non-compliant QC Result (See Q Flag Application Report)
*****	Indicates a non-compliant or not applicable QC recovery or RPD – see narrative
E	The result is estimated because it exceeded the instrument calibration range
E	Metals - % diference for the serial dilution is > 10%
P	**RPD between primary and confirmation result is greater than 40**

Sample receipt at GCAL is documented through the attached chain of custody. In accordance with NELAC, this report shall be reproduced only in full and with the written permission of GCAL. The results contained within this report relate only to the samples reported. The documented results are presented within this report.

This report pertains only to the samples listed in the Report Sample Summary and should be retained as a permanent record thereof. The results contained within this report are intended for the use of the client. Any unauthorized use of the information contained in this report is prohibited.

I certify that this data package is in compliance with The NELAC Institute (TNI) Standard 2009 and terms and conditions of the contract and Statement of Work both technically and for completeness, for other than the conditions in the case narrative. Release of the data contained in this hardcopy data package and in the computer readable data submitted has been authorized by the Quality Assurance Manager or his/her designee, as verified by the following signature.

Estimated uncertainty of measurement is available upon request. This report is in compliance with the DOD QSM as specified in the contract if applicable.

Case Narrative

Client: AECOM **Report:** 216012515

Gulf Coast Analytical Laboratories received and analyzed the sample(s) listed on the Report Sample Summary page of this report. Receipt of the sample(s) is documented by the attached chain of custody. This applies only to the sample(s) listed in this report. No sample integrity or quality control exceptions were identified unless noted below.

This report was revised 02/04/16 with corrected client IDs for samples 21601251513 (OMS-28-1) and 21601251514 (OMS-28-3-a).

VOLATILES MASS SPECTROMETRY

In the EPA 8260B analysis, sample 21601251504 (OMS-28-5) had to be diluted to bracket the concentration of target compounds within the calibration range of the instrument. The dilution is reflected in elevated detection limits.

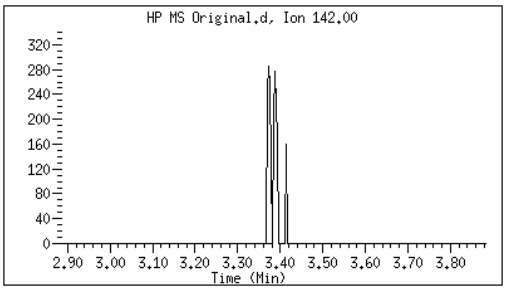
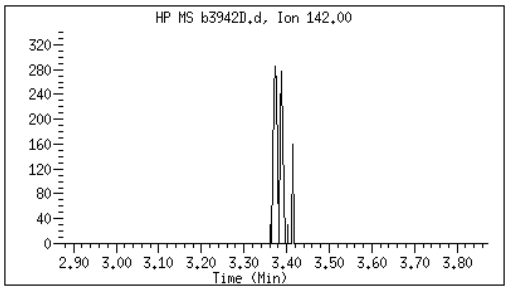
13 Methyl Iodide CAS#: 74-88-4 Reason: M2



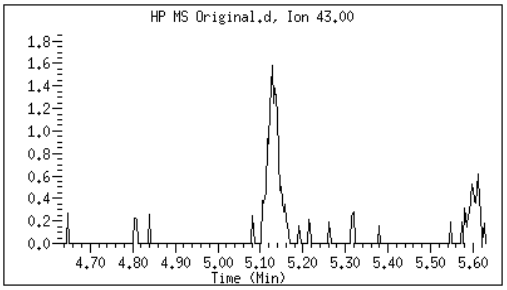
Electronic Signature Applied

User: jck2
Date: 01/18/2016 15:45



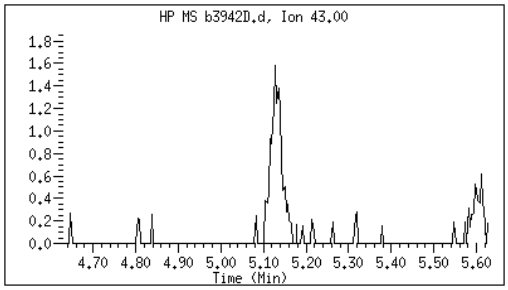
Original Final

28 Vinyl Acetate CAS#: 108-05-4 Reason: M1



Electronic Signature Applied

User: jck2
Date: 01/18/2016 15:45



M1 - Target system did not integrate
M2 - Target system integrated incorrectly

QC Flag Legend

A - Target compound detected but, quantitated amount exceeded maximum amount.
M2- Compound response manually integrated because Target system integrated incorrectly.

Laboratory Endorsement

Sample analysis was performed in accordance with approved methodologies provided by the Environmental Protection Agency or other recognized agencies. The samples and their corresponding extracts will be maintained for a period of 30 days unless otherwise arranged. Following this retention period the samples will be disposed in accordance with GCAL's Standard Operating Procedures.

Common Abbreviations that may be Utilized in this Report

ND	Indicates the result was Not Detected at the specified reporting limit
NO	Indicates the sample did not ignite when preliminary test performed for EPA Method 1030
DO	Indicates the result was Diluted Out
MI	Indicates the result was subject to Matrix Interference
TNTC	Indicates the result was Too Numerous To Count
SUBC	Indicates the analysis was Sub-Contracted
FLD	Indicates the analysis was performed in the Field
DL	Detection Limit
DL	Diluted analysis – when appended to Client Sample ID
LOD	Limit of Detection
LOQ	Limit of Quantitation
RE	Re-analysis
CF	HPLC or GC Confirmation
00:01	Reported as a time equivalent to 12:00 AM

Reporting Flags that may be Utilized in this Report

J or I	Indicates the result is between the MDL and LOQ
J	DOD flag on analyte in the parent sample for MS/MSD outside acceptance criteria
U	Indicates the compound was analyzed for but not detected
B or V	Indicates the analyte was detected in the associated Method Blank
Q	Indicates a non-compliant QC Result (See Q Flag Application Report)
*****	Indicates a non-compliant or not applicable QC recovery or RPD – see narrative
E	The result is estimated because it exceeded the instrument calibration range
E	Metals - % diference for the serial dilution is > 10%
P	RPD between primary and confirmation result is greater than 40

Sample receipt at GCAL is documented through the attached chain of custody. In accordance with NELAC, this report shall be reproduced only in full and with the written permission of GCAL. The results contained within this report relate only to the samples reported. The documented results are presented within this report.

This report pertains only to the samples listed in the Report Sample Summary and should be retained as a permanent record thereof. The results contained within this report are intended for the use of the client. Any unauthorized use of the information contained in this report is prohibited.

I certify that this data package is in compliance with The NELAC Institute (TNI) Standard 2009 and terms and conditions of the contract and Statement of Work both technically and for completeness, for other than the conditions in the case narrative. Release of the data contained in this hardcopy data package and in the computer readable data submitted has been authorized by the Quality Assurance Manager or his/her designee, as verified by the following signature.

Estimated uncertainty of measurement is available upon request. This report is in compliance with the DOD QSM as specified in the contract if applicable.

Case Narrative

Client: AECOM **Report:** 217050803

Gulf Coast Analytical Laboratories received and analyzed the sample(s) listed on the Report Sample Summary page of this report. Receipt of the sample(s) is documented by the attached chain of custody. This applies only to the sample(s) listed in this report. No sample integrity or quality control exceptions were identified unless noted below.

VOLATILES MASS SPECTROMETRY

In the EPA 8260B analysis, samples 21705080311 (OMS-28-GW32-12-S), 21705080317 (OMS-28-5), and 21705080318 (OMS-28-5-a) had to be diluted to bracket the concentration of target analytes within the calibration range of the instrument. The dilutions are reflected in elevated detection limits.

Q Flag Summary

FIT = %RSD For Average Curve And Calibration Coefficent For Linear And Quadratic

Curve Types: A - Averged, L - Linear Regression, W - Weighted Linear, Q - Quadratic

For curve types L and Q, the RRF and RSP (Response) are shown on separate lines to allow for evaluation against minimum RRF

$\overline{RF}$ = Mean Response Factor For Average Curve

m,b = Slope and Intercept For Linear Curve

A,B,C = Coefficents For Quadratic Curve

QC Flag Legend

a - Target compound detected but, quantitated amount
Below Limit Of Quantitation(BLOQ).
M2- Compound response manually integrated because
Target system integrated incorrectly.
H - Operator selected an alternate compound hit.

QC Flag Legend

a - Target compound detected but, quantitated amount
Below Limit Of Quantitation(BLOQ).
M1- Compound response manually integrated because
Target system did not integrate.
M2- Compound response manually integrated because
Target system integrated incorrectly.

QC Flag Legend

A - Target compound detected but, quantitated amount exceeded maximum amount.
M1- Compound response manually integrated because Target system did not integrate.
M2- Compound response manually integrated because Target system integrated incorrectly.

RE: REVISED: ARMY NATIONAL GUARD - OMS #28 MOBILE, ALABAMA
Project Number: W90FYQ-10-D-0010 contract, task order CK02

Dear Steve:

Enclosed is the REVISION to the final report of the on-site analysis performed by Columbia Technologies, LLC at the above referenced site. Samples were collected May 2nd through the 19th, 2017

Columbia Technologies' mobile laboratory is DOD-ELAP and ISO/IEC 17025:2005 Accredited. Our personnel, methodology, proficiency testing, and quality assurance requirements comply with the guidelines and with the consensus standards adopted at the National Environmental Laboratory Accreditation Conference (NELAC). Data for the site referenced above were determined in accordance with published procedures under Test Methods for Evaluating Solid Waste (EPA SW-846, Update III Revised May 1997). Unless otherwise indicated on the quality control narrative accompanying the data report, the quality assurance and quality control procedures performed in conjunction with analysis of groundwater samples and soils demonstrated that the reported data met our requirements for accuracy and precision under NELAC Standards.

This report shall not be reproduced except in full without written approval of the laboratory.

If you have any questions, please do not hesitate to call me at (321) 213-9078.

Sincerely,

Melanie Penny
Laboratory Manager
Columbia Technologies, LLC

Narratives

PROJECT NARRATIVE

Project Scope

On May 2nd through the 19th, 2017 water and soil samples were analyzed by method 8260B at the Army National Guard - OMS #28 Mobile, Alabama

Laboratory Certification

Columbia Technologies Mobile Unit 10 is DOD-ELAP and ISO/IEC 17025:2005 Accredited.

Analytical Procedure

All water samples were analyzed using SW846 Method 5030a/8260b. Ten (10) milliliters (mL) of water was purged with helium and the volatile organic compounds (VOCs) were collected on a solid-phase adsorption trap. The adsorption trap was heated and back-purged with helium. The components were then separated by capillary column gas chromatography and measured with a mass spectrometer (GC/MS) operated in the electron impact full-scan mode. The individual VOCs in the samples were measured against corresponding VOC standards.

The soil samples were analyzed using SW846 Method 5035/8260B. Five (5) grams (g) of soil sample was added to 10 mL of laboratory reagent water, heated and purged with helium. Analysis then continued as for waters.

The soil samples needing dilution were analyzed using SW846 5030a/8260b. Five (5) grams of soil was added to 10 mL of Methanol. 100 µL or less of the methanol extract was added to 10 mL of laboratory water, heated and purged with helium. The analysis then continued as for waters.

Analytical Results

Laboratory results were provided to the client on an as-completed or next-day basis. Final results of the on-site analyses are provided in a hardcopy report and the results relate only to the actual samples received and analyzed in the laboratory. The data produced and reported in the field has been reviewed and approved for this final report by the Client Services Manager.

Data Qualifiers:

U Analyte was analyzed for but not detected.
J Estimated values.
E Result exceeds upper calibration curve.

Uncertainty of Reported Values

All measurement data presented in this report are subject to a degree of uncertainty and the degree of uncertainty varies with each compound of interest. Columbia Technologies estimates the uncertainty of each measurement using a statistical evaluation of the standard deviation from the mean percent recovery of several trials of a given measurement. More specifically, Columbia Technologies maintains historical percent recovery control limits at the 99% confidence level for each analyte of interest. These are calculated as ± 3 times the standard deviation from the mean of historical measurements of the percent recovery of spikes of the analytes of interest into actual and control sample matrices. For example, if the lower and upper percent recovery control limits for a specific analyte of interest have been determined to be 70 and 130 percent respectively, a reported value of 10.0 ug/L will be with 99% confidence 7.0 to 13.0 ug/L. For more information about Columbia Technologies estimation of uncertainty, contact Columbia Technologies' Quality Assurance Officer and/or request a copy of Columbia Technologies' SOP for determining measurement uncertainty.

Quality Control (QC) Results

Tables detailing QC results are included with this report. Please see attached.

ANALYTICAL REPORT NARRATIVE

1. All sample data have been reviewed and, if required, updated in the Final Report for rounding and significant figures.
2. Sample OMS-28-GW17-18 result was corrected on the finalized sample report to 6.7 ug/L from 6.8 ug/L.
3. Sample OMS-28-GW31-31 was ran on May 2nd, 2017 as an unsettled sample. The sample was allowed to settle overnight and reanalyzed on May 3rd, 2017. Both results are reported.
4. The time analyzed was corrected for several samples on the Final Report.
5. When necessary, manual integrations were performed on samples in accordance with the laboratory procedures.
6. When necessary, the chain of custody forms were corrected to reflect correct laboratory sample ids.
7. The correct sample identification for the sample collected on 5/11/17 at 09:05 was OMS-28-GW38-18. The chain of custody was corrected to reflect the ID.

8. The correct sample identification for the sample collected on 5/19/17 at 12:40 is OMS-28-GW71-30. The chain of custody was corrected to reflect the ID.
9. Samples with associated quality control samples that were out of laboratory acceptable range were qualified.
10. Matrix interference issues were observed in surrogates for soil samples primarily collected in the 1 to 2-foot range. Selected samples were re-analyzed to confirm the matrix interference.
11. The report was updated to include results from OMS28-GW30-11, OMS28-GW30-20 and OMS28-GW60-16.

Sample Delivery Details / Laboratory Receipt

Delivered Directly to Lab: X
Method of Shipment:
Analytical Lab: Columbia Technologies
Lab Receipient:
Shipped:
Airbill #:
Location: On Site
Date: Time:

1.) Sample Type (SA) Codes: N = Normal Sample, TB = Trip Blank (-c) Sample, FD = Field Duplicate (-a) Samples, FR = Field Replicate (-b) Samples, EB = Equipment Blank (-d) Samples, MS = Matrix Spike Samples, SD = Matrix Spike Duplicate Samples

2.) Matrix Codes: GS = Soil Gas, WG = Groundwater, WS = Surface Water, SO = Soil, SE = Sediment, SL = Sludge, SS = Surface Soil Samples, WQ = Aqueous Blank Samples (trip, equipment, ambient, etc), SQ = Soil Blanks

LABORATORY CONTROL SAMPLES

COLUMBIA TECHNOLOGIES

Table 1: VOC Spike Compound Percent Recoveries

Client: AECOM	**Sampler: AECOM**	**Analyst: R. Costa and R. George**
Site: Brookley	**Columbia Technologies PM:** Melanie Penny	**Project No.: 60439687**
Dates: May 2 - 19, 2017	**Client Project Manager: Steve Holt**	**Matrix**: **Soil and Water**

Laboratory Control Spikes (LCS):

Samples: LCS 1 - WATER, LCS 2 - WATER, LCS 3 - WATER — **Date of Analysis:** 5/2/17, 5/3/17, 5/4/17

Spike Compounds	Control Limits			Percent Recoveries			Control Limit Checks		
	Lower		Upper	LCS 1	LCS 2	LCS 3	LCS 1	LCS 2	LCS 3
Trichloroethene	55	to	145	97	122	109	Pass	Pass	Pass
Tetrachloroethene	53	to	147	92	112	103	Pass	Pass	Pass

Samples: LCS 4 - WATER, LCS 5 - WATER, LCS 6 - SOIL — **Date of Analysis:** 5/5/17, 5/8/17, 5/8/17

Spike Compounds	Control Limits			Percent Recoveries			Control Limit Checks		
	Lower		Upper	LCS 4	LCS 5	LCS 6	LCS 4	LCS 5	LCS 6
Trichloroethene	55	to	145	94	122	96	Pass	Pass	Pass
Tetrachloroethene	53	to	147	90	111	88	Pass	Pass	Pass

Samples: LCS 7 - SOIL, LCS 8 - SOIL, LCS 9 - WATER — **Date of Analysis:** 5/8/17, 5/9/17, 5/9/17

Spike Compounds	Control Limits			Percent Recoveries			Control Limit Checks		
	Lower		Upper	LCS 7	LCS 8	LCS 9	LCS 7	LCS 8	LCS 9
Trichloroethene	55	to	145	126	88	85	Pass	Pass	Pass

GCAL Report 217051316

Project ARNG OMS 28/ 60439687

Deliver To	***Additional Recipients***
Steve Holt AECOM 10 Patewood Drive, Bldg. VI Suite 500 Greenville, SC 29615 864-234-2260	NONE

Laboratory Endorsement

Sample analysis was performed in accordance with approved methodologies provided by the Environmental Protection Agency or other recognized agencies. The samples and their corresponding extracts will be maintained for a period of 30 days unless otherwise arranged. Following this retention period the samples will be disposed in accordance with GCAL's Standard Operating Procedures.

Common Abbreviations that may be Utilized in this Report

ND	Indicates the result was Not Detected at the specified reporting limit
NO	Indicates the sample did not ignite when preliminary test performed for EPA Method 1030
DO	Indicates the result was Diluted Out
MI	Indicates the result was subject to Matrix Interference
TNTC	Indicates the result was Too Numerous To Count
SUBC	Indicates the analysis was Sub-Contracted
FLD	Indicates the analysis was performed in the Field
DL	Detection Limit
DL	Diluted analysis – when appended to Client Sample ID
LOD	Limit of Detection
LOQ	Limit of Quantitation
RE	Re-analysis
CF	HPLC or GC Confirmation
00:01	Reported as a time equivalent to 12:00 AM

Reporting Flags that may be Utilized in this Report

J or I	Indicates the result is between the MDL and LOQ
J	DOD flag on analyte in the parent sample for MS/MSD outside acceptance criteria
U	Indicates the compound was analyzed for but not detected
B or V	Indicates the analyte was detected in the associated Method Blank
Q	Indicates a non-compliant QC Result (See Q Flag Application Report)
*****	Indicates a non-compliant or not applicable QC recovery or RPD – see narrative
E	The result is estimated because it exceeded the instrument calibration range
E	Metals - % diference for the serial dilution is > 10%
P	RPD between primary and confirmation result is greater than 40

Sample receipt at GCAL is documented through the attached chain of custody. In accordance with NELAC, this report shall be reproduced only in full and with the written permission of GCAL. The results contained within this report relate only to the samples reported. The documented results are presented within this report.

This report pertains only to the samples listed in the Report Sample Summary and should be retained as a permanent record thereof. The results contained within this report are intended for the use of the client. Any unauthorized use of the information contained in this report is prohibited.

I certify that this data package is in compliance with The NELAC Institute (TNI) Standard 2009 and terms and conditions of the contract and Statement of Work both technically and for completeness, for other than the conditions in the case narrative. Release of the data contained in this hardcopy data package and in the computer readable data submitted has been authorized by the Quality Assurance Manager or his/her designee, as verified by the following signature.

Estimated uncertainty of measurement is available upon request. This report is in compliance with the DOD QSM as specified in the contract if applicable.

Case Narrative

Client: AECOM **Report:** 217051316

Gulf Coast Analytical Laboratories received and analyzed the sample(s) listed on the Report Sample Summary page of this report. Receipt of the sample(s) is documented by the attached chain of custody. This applies only to the sample(s) listed in this report. No sample integrity or quality control exceptions were identified unless noted below.

No anomalies were found for the analyzed sample(s).

QC Flag Legend

M1- Compound response manually integrated because
Target system did not integrate.
M2- Compound response manually integrated because
Target system integrated incorrectly.
M3- Compound response manually integrated because
Target system integrated incorrect peak.
H - Operator selected an alternate compound hit.

Line Item(s) 1 - W - VOCs	**Receive Date(s)** 05/13/17

CHECKLIST	YES	NO	NA
Samples received with proper thermal and chemical preservation?	☑	☐	☐
Radioactivity is <1600 cpm? If no, record cpm value in notes section.	☑	☐	☐
When used, were custody seals intact?	☑	☐	☐
COC relinquished and complete (including sample IDs, collect dates/times, and sampler name)?	☑	☐	☐
Short holds or RUSH samples received?	☐	☑	☐
All containers received in good condition and within hold time?	☑	☐	☐
All sample labels and containers received match the chain of custody?	☑	☐	☐
Preservation checked at receipt? Exceptions: VOC, Coliform, TOC, Oil and Grease, DOC	☐	☐	☑
Preservative added to any containers?	☐	☐	☑
VOC water containers received with headspace < 6mm?	☑	☐	☐
Received filtered sample volume for dissolved analysis?	☐	☐	☑
Trip blank present in all coolers containing VOC waters?	☑	☐	☐
Samples collected in containers provided by GCAL?	☑	☐	☐

Baton Rouge, LA 70820

Report Date 05/22/2017

GCAL Report 217051110

Project ARNG OMS 28/ 60439687

Deliver To	***Additional Recipients***
Steve Holt AECOM 10 Patewood Drive, Bldg. VI Suite 500 Greenville, SC 29615 864-234-2260	NONE

Laboratory Endorsement

Sample analysis was performed in accordance with approved methodologies provided by the Environmental Protection Agency or other recognized agencies. The samples and their corresponding extracts will be maintained for a period of 30 days unless otherwise arranged. Following this retention period the samples will be disposed in accordance with GCAL's Standard Operating Procedures.

Common Abbreviations that may be Utilized in this Report

ND	Indicates the result was Not Detected at the specified reporting limit
NO	Indicates the sample did not ignite when preliminary test performed for EPA Method 1030
DO	Indicates the result was Diluted Out
MI	Indicates the result was subject to Matrix Interference
TNTC	Indicates the result was Too Numerous To Count
SUBC	Indicates the analysis was Sub-Contracted
FLD	Indicates the analysis was performed in the Field
DL	Detection Limit
DL	Diluted analysis – when appended to Client Sample ID
LOD	Limit of Detection
LOQ	Limit of Quantitation
RE	Re-analysis
CF	HPLC or GC Confirmation
00:01	Reported as a time equivalent to 12:00 AM

Reporting Flags that may be Utilized in this Report

J or I	Indicates the result is between the MDL and LOQ
J	DOD flag on analyte in the parent sample for MS/MSD outside acceptance criteria
U	Indicates the compound was analyzed for but not detected
B or V	Indicates the analyte was detected in the associated Method Blank
Q	Indicates a non-compliant QC Result (See Q Flag Application Report)
*****	Indicates a non-compliant or not applicable QC recovery or RPD – see narrative
E	The result is estimated because it exceeded the instrument calibration range
E	Metals - % diference for the serial dilution is > 10%
P	RPD between primary and confirmation result is greater than 40

Sample receipt at GCAL is documented through the attached chain of custody. In accordance with NELAC, this report shall be reproduced only in full and with the written permission of GCAL. The results contained within this report relate only to the samples reported. The documented results are presented within this report.

This report pertains only to the samples listed in the Report Sample Summary and should be retained as a permanent record thereof. The results contained within this report are intended for the use of the client. Any unauthorized use of the information contained in this report is prohibited.

I certify that this data package is in compliance with The NELAC Institute (TNI) Standard 2009 and terms and conditions of the contract and Statement of Work both technically and for completeness, for other than the conditions in the case narrative. Release of the data contained in this hardcopy data package and in the computer readable data submitted has been authorized by the Quality Assurance Manager or his/her designee, as verified by the following signature.

Estimated uncertainty of measurement is available upon request. This report is in compliance with the DOD QSM as specified in the contract if applicable.

Case Narrative

Client: AECOM **Report:** 217051110

Gulf Coast Analytical Laboratories received and analyzed the sample(s) listed on the Report Sample Summary page of this report. Receipt of the sample(s) is documented by the attached chain of custody. This applies only to the sample(s) listed in this report. No sample integrity or quality control exceptions were identified unless noted below.

VOLATILES MASS SPECTROMETRY

In the EPA 8260B analysis, samples 21705111009 (OMS-28-SB24-1-S), 21705111010 (OMS-28-SB24-3-S), and 21705111011 (OMS-28-SB24-5-S) had to be diluted to bracket the concentration of target analytes within the calibration range of the instrument. The dilutions are reflected in elevated detection limits.

Q Flag Summary
